Hovering Dragon

This project is a 3D creation that fuses futuristic technology with emergency-response concepts — a levitating firefighting supercar. Powered by an anti-gravity propulsion system, the vehicle offers high-speed maneuverability and aerial mobility tailored for emergency firefighting operations in high-density urban environments.

Its body combines the streamlined aesthetics of a sports car with multifunctional firefighting equipment, integrating high-pressure water cannons, thermal detection scanners, and various operational tools. Balancing visual impact with practical functionality, the design presents a visionary concept of what future firefighting vehicles could become.

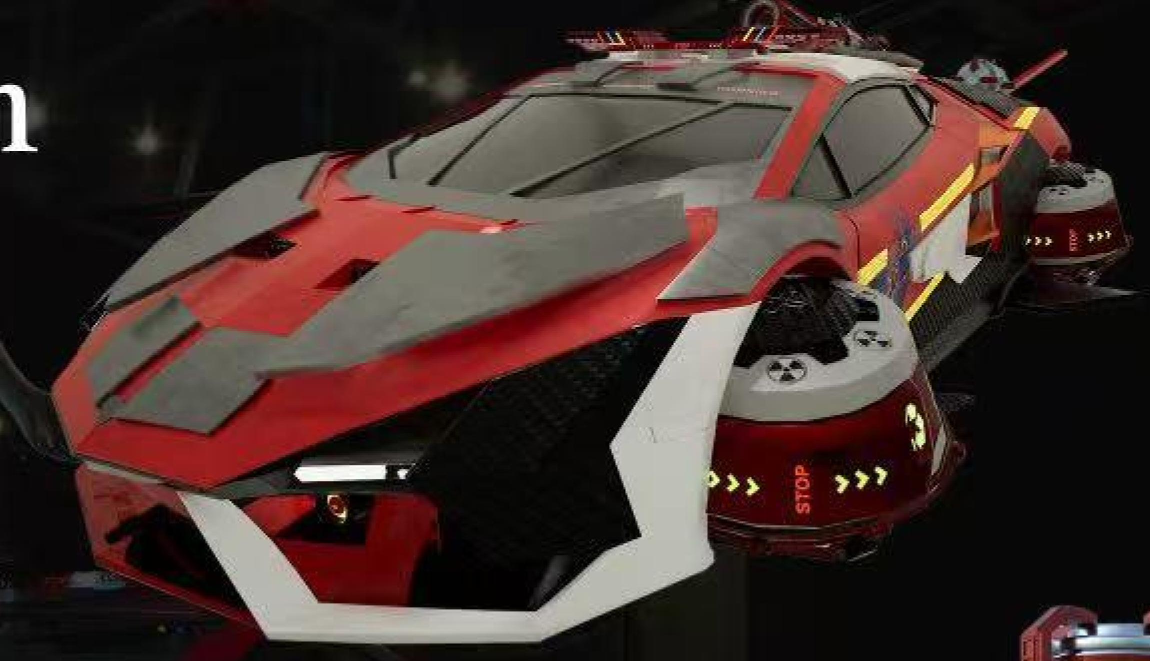
Hovering Dragon

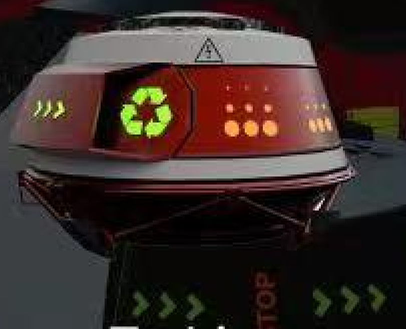
Wildfires

Wildfires typically occur during hot and dry seasons. They ignite at scattered points and spread rapidly, often caused by lightning strikes or human activities. For example, in the 2023 global wildfire events, Canada alone saw over 18 million hectares burned, resulting in dozens of deaths, thousands of evacuations, and severe threats to both ecosystems and human safety.

Urban Fires

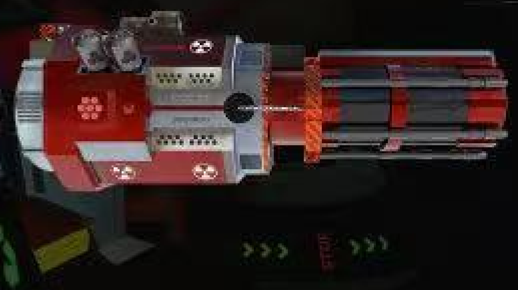
Urban fires often break out in residential areas, commercial districts, or industrial zones. They develop quickly and are frequently accompanied by extreme heat, toxic smoke, and difficult evacuation conditions. In recent years, China has recorded around 80,000 urban fires annually, causing hundreds of deaths. The risks are especially high in aging neighborhoods and high-rise buildings, highlighting the urgent need for efficient rescue solutions.





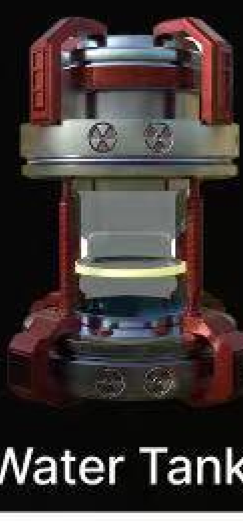
Turbine

This firefighting hover super car is equipped with dual-side turbine thrusters combined with magnetic levitation technology, enabling stable hovering and high-speed flight. The turbines feature vector nozzles capable of adjusting thrust in multiple directions to adapt to complex terrain. Its specialized exterior shell is heat-resistant and supports an emergency acceleration mode, ensuring both rescue speed and operational safety.



Water Cannons

A 360-degree rotating high-pressure water cannon is mounted on the roof, featuring automatic heat-source detection and precise targeting capabilities. It supports remote control and multiple spray modes, enabling effective response to various fire scenarios while ensuring efficient extinguishing and personnel safety.



Water Tank

The onboard water tank utilizes a lightweight, high-pressure storage design with automatic pressure regulation and intelligent capacity monitoring, ensuring uninterrupted, long-duration firefighting operations.

Prototype car

Original Model Overview: Lamborghini Revuelto

The Lamborghini Revuelto is a high-performance hybrid super car that combines a naturally aspirated V12 engine with an electric super car. With its aggressive aerodynamic design and strong futuristic aesthetics, it represents a significant milestone in Lamborghini's transition toward electrification.

Model Modification: Transforming it into a Firefighting Hover Super car

Building upon the original Revuelto, I conducted extensive functional and visual modifications to equip it with urban aerial firefighting capabilities:

- Reinforced Armor Structure: The body was strengthened with modular armor components to enhance resistance against impacts in fire or falling-debris environments.
- Integrated High-Pressure Water Cannon: A rotating high-pressure water cannon was added to the roof, supporting remote precision spraying and heat-source locking for high-rise firefighting.
- Hover Turbine System Installation: Magnetic-levitation turbine units were mounted on the chassis and rear section, enabling vertical takeoff, hovering, and adaptation to complex terrain and aerial rescue tasks.

Through these three core modifications, the Revuelto is transformed into a futuristic firefighting hover vehicle—combining speed, functionality, and a distinctly sci-fi aesthetic tailored for next-generation urban rescue missions.
