
MUSHROOM GARDEN

The significance of this project lies in reinterpreting and presenting the charm of classical Chinese literature through modern technology, allowing a global audience to experience the distant and mysterious ideal world described in The Peach Blossom Spring from a fresh perspective. Through 3D visualization, viewers are able to immerse themselves in the scenes depicted in the text and gain a more intuitive understanding of the literary work's deeper meanings.

INSPIRATION:

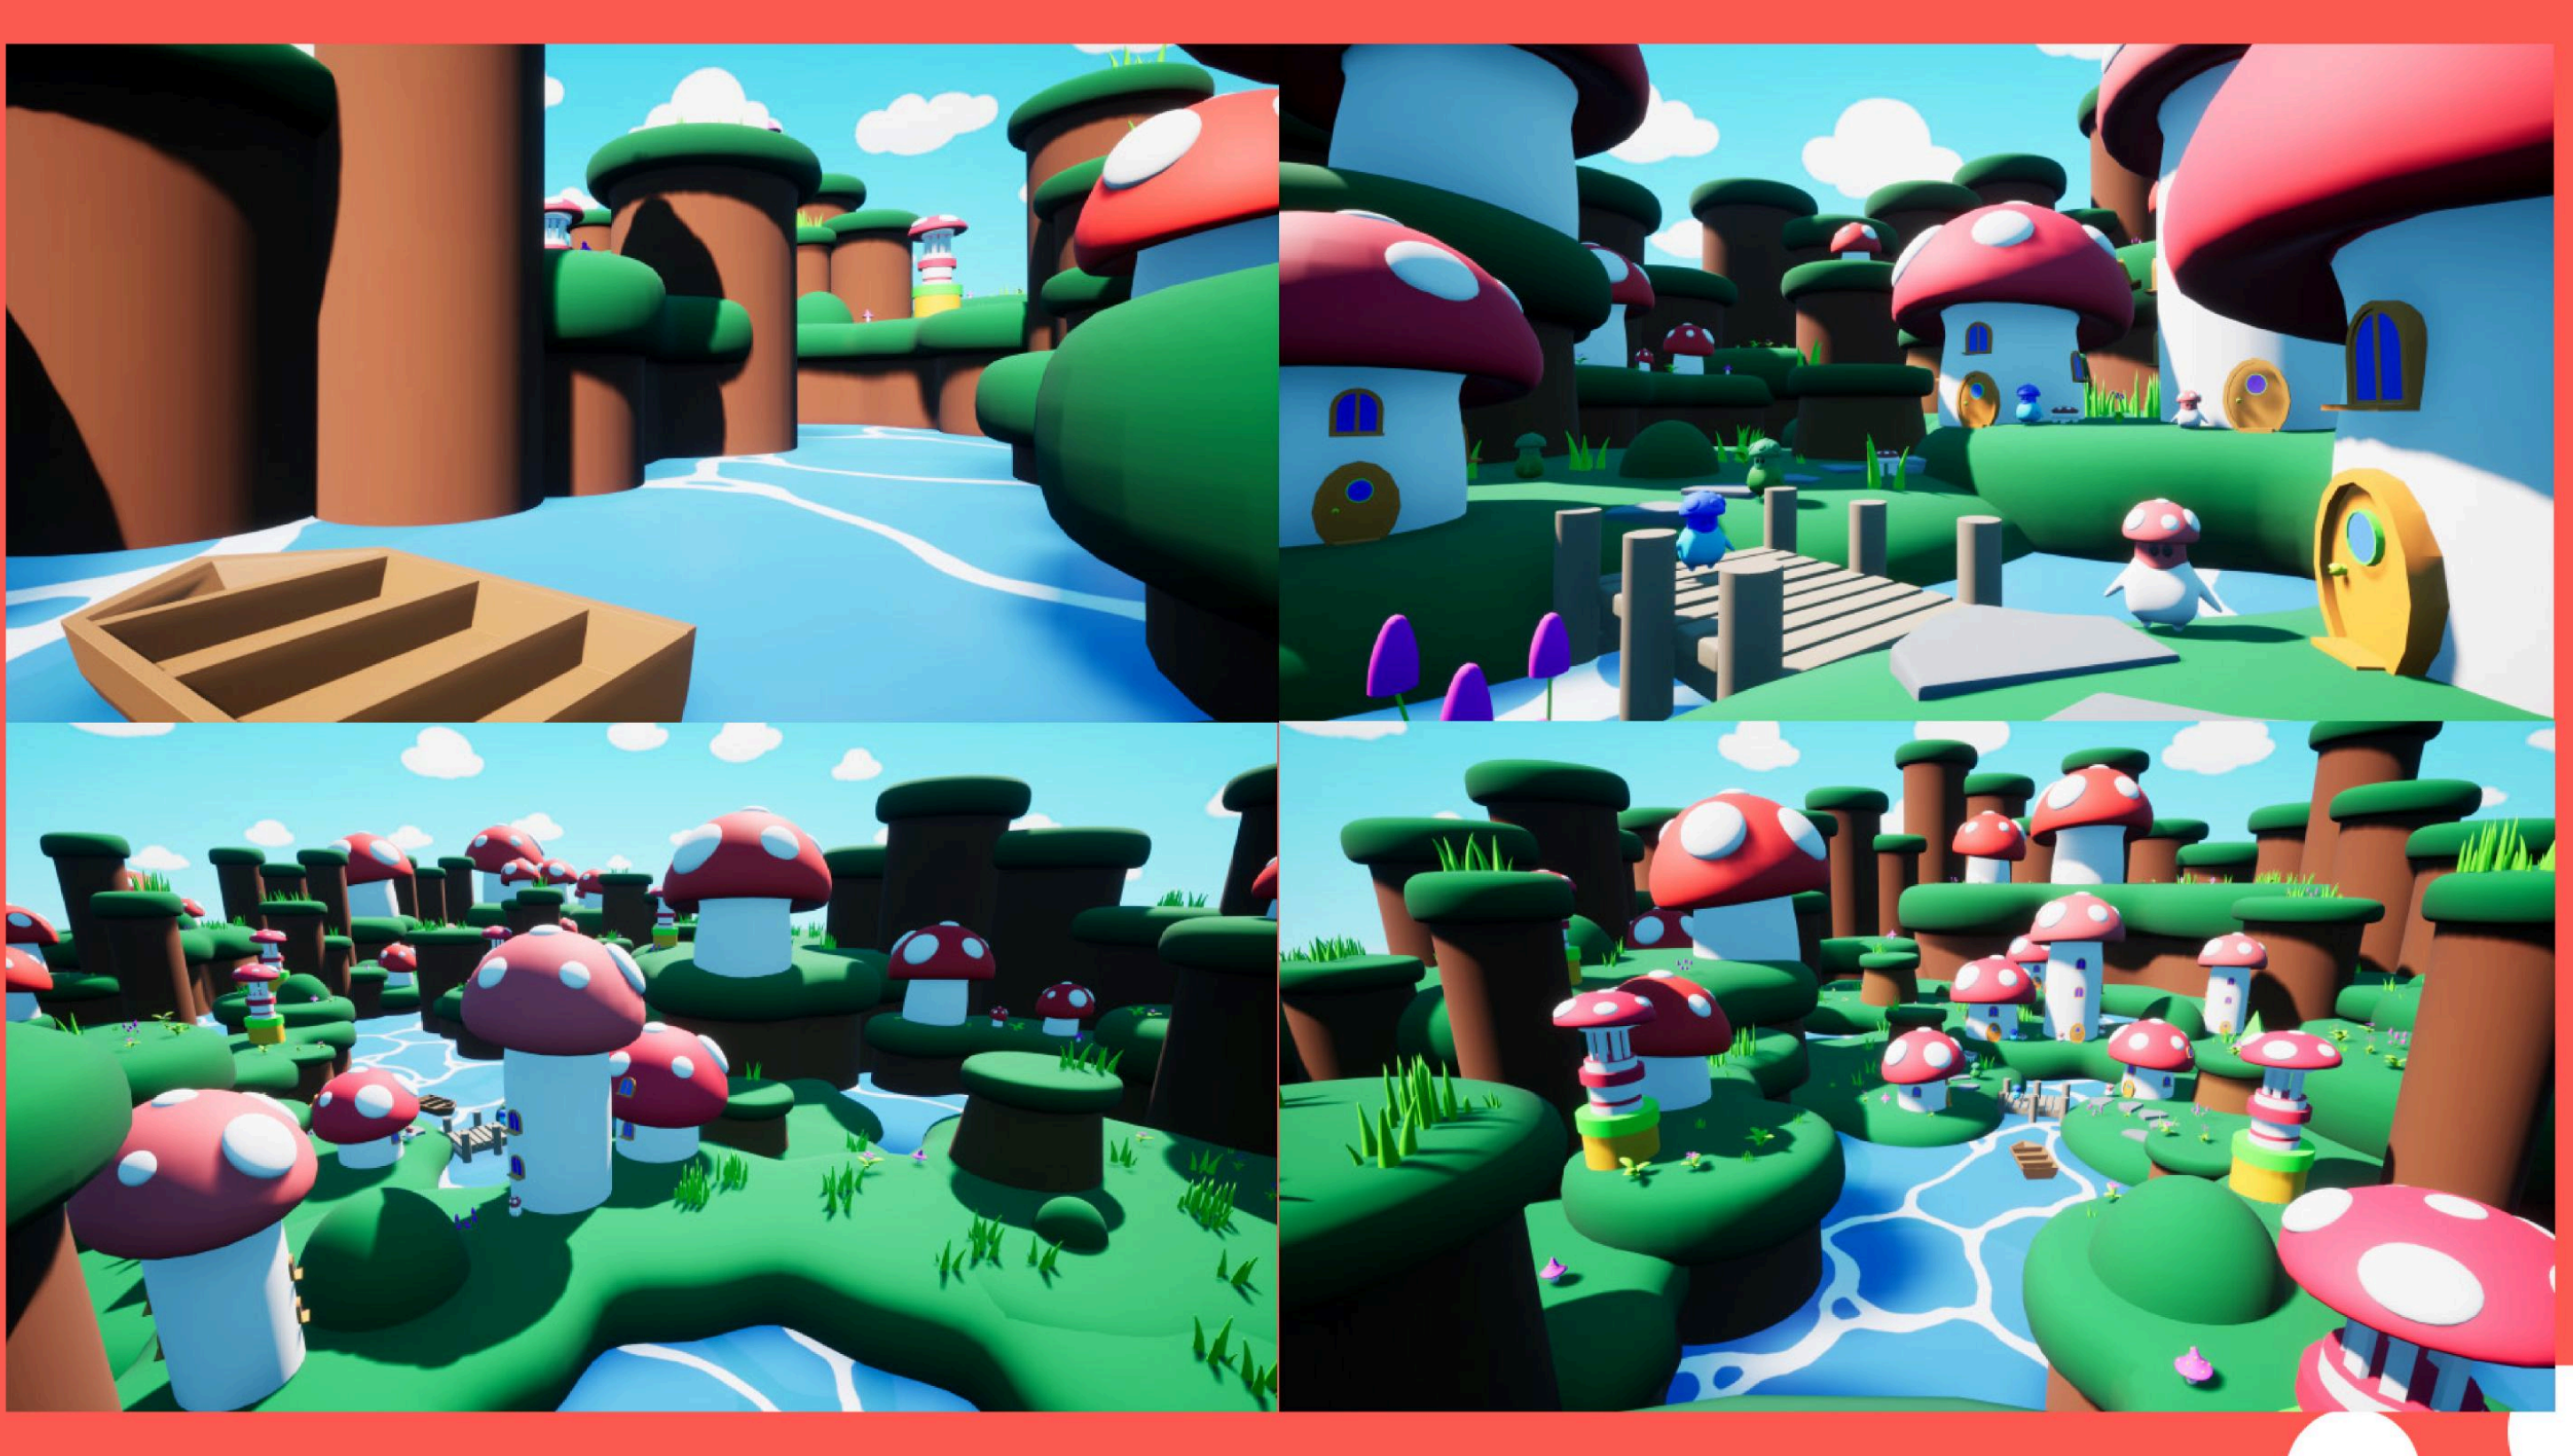
THE PEACH BLOSSOM SPRING

Inspiration Source: The Peach Blossom Spring

This project is inspired by The Peach Blossom Spring, a classical work by the ancient Chinese poet Tao Yuanming. The text tells the story of an ideal land—Peach Blossom Spring—discovered by chance by a recluse. Surrounded by natural beauty, its inhabitants live simple and joyful lives, completely isolated from the outside world, forming a utopia free from war and suffering.

Inspiration Source: Mushroom Village

This mushroom-themed scene is inspired by Super Mario. I've always been drawn to the magical and charming mushrooms in the game, so I wanted to recreate that fairy-tale atmosphere in my own way.

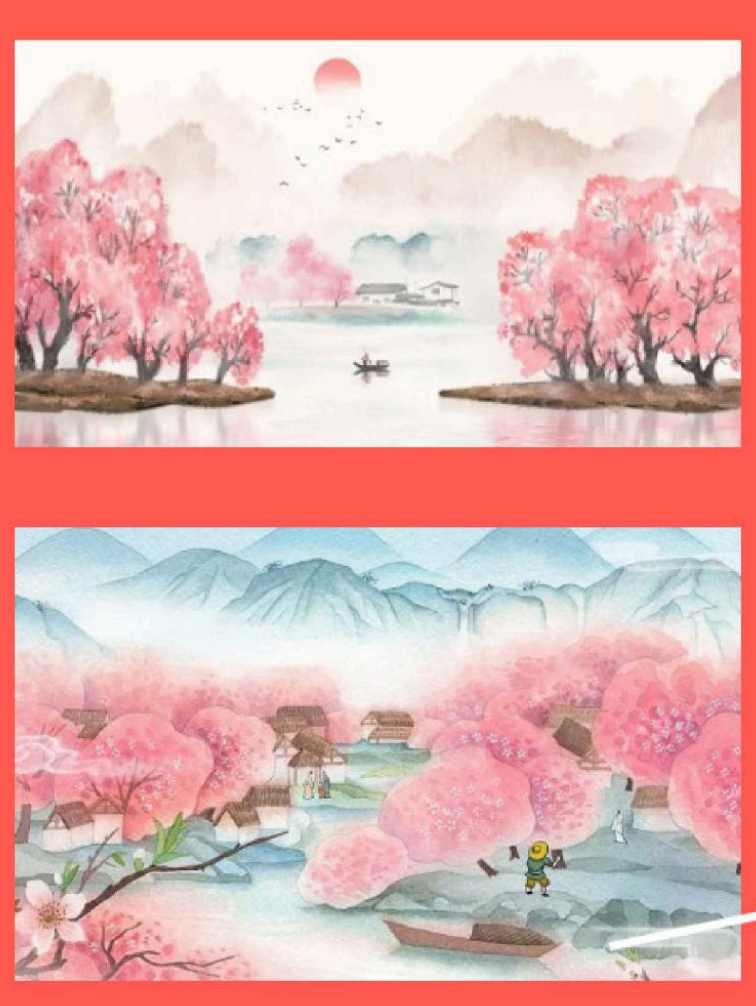


BACKGROUND

THE PEACH BLOSSOM SPRING

During the Taiyuan period of the Eastern Jin Dynasty, a fisherman from Wuling accidentally discovered a breathtaking peach blossom grove. Following a stream, he entered a glowing cave and emerged into a secluded village. There, people lived simple and peaceful lives, unaware of the outside world after fleeing the turmoil of the Qin Dynasty.

The villagers welcomed the fisherman warmly but asked him not to reveal their location. After leaving, he attempted to return and reported the discovery to the local governor, yet the village could never be found again. Later, a man named Liu Ziji set out in search of the hidden land, but died before succeeding. From then on, the Peach Blossom Spring was never seen again.



I referred to the original literary text and used relevant visual references found online to roughly reconstruct the 3D scene layout.

Procedural Foliage System

Spawns in Shade: Allows plants to spawn in shaded areas (note: some plants prefer shaded environments).
Max Initial Age: The maximum initial age at which a plant can spawn, affecting its starting size.
Max Age: The maximum age a plant can grow to, influencing its final size and form.
Can Grow in Shade: Enables plants to continue growing in shaded areas.
Overlap Priority: Overlap priority—higher values mean the plant is more likely to be preserved when overlaps occur.
Procedural Scale: The scale range for procedurally generated plants, controlling size variation (e.g., Min = 1.2, Max = 1.8 means plant size will randomly vary between 1.2× and 1.8×).
Num Steps: Number of simulation steps. Higher values result in more natural distribution but are more performance-intensive.
Initial Seed Density: Initial seed density—higher values produce denser vegetation.
Align Max Angle: Maximum alignment angle of the plant, commonly used to limit tilt.
Random Pitch Angle: Random tilt angle to increase natural variation.
Ground Slope Angle: Allowed ground slope range (Min–Max) for plant placement; plants will not spawn on slopes that are too steep.

First, I created a terrain and then set up different foliage types, such as trees, grass, and flowers. Next, I placed a Procedural Foliage Volume and added these vegetation types into it. After that, I simply needed to click "Resimulate," and the entire area was automatically filled with various kinds of plants, including grass and flowers. Finally, based on my needs, I adjusted the Initial Seed Density and Procedural Scale to make the overall scene look more natural.
