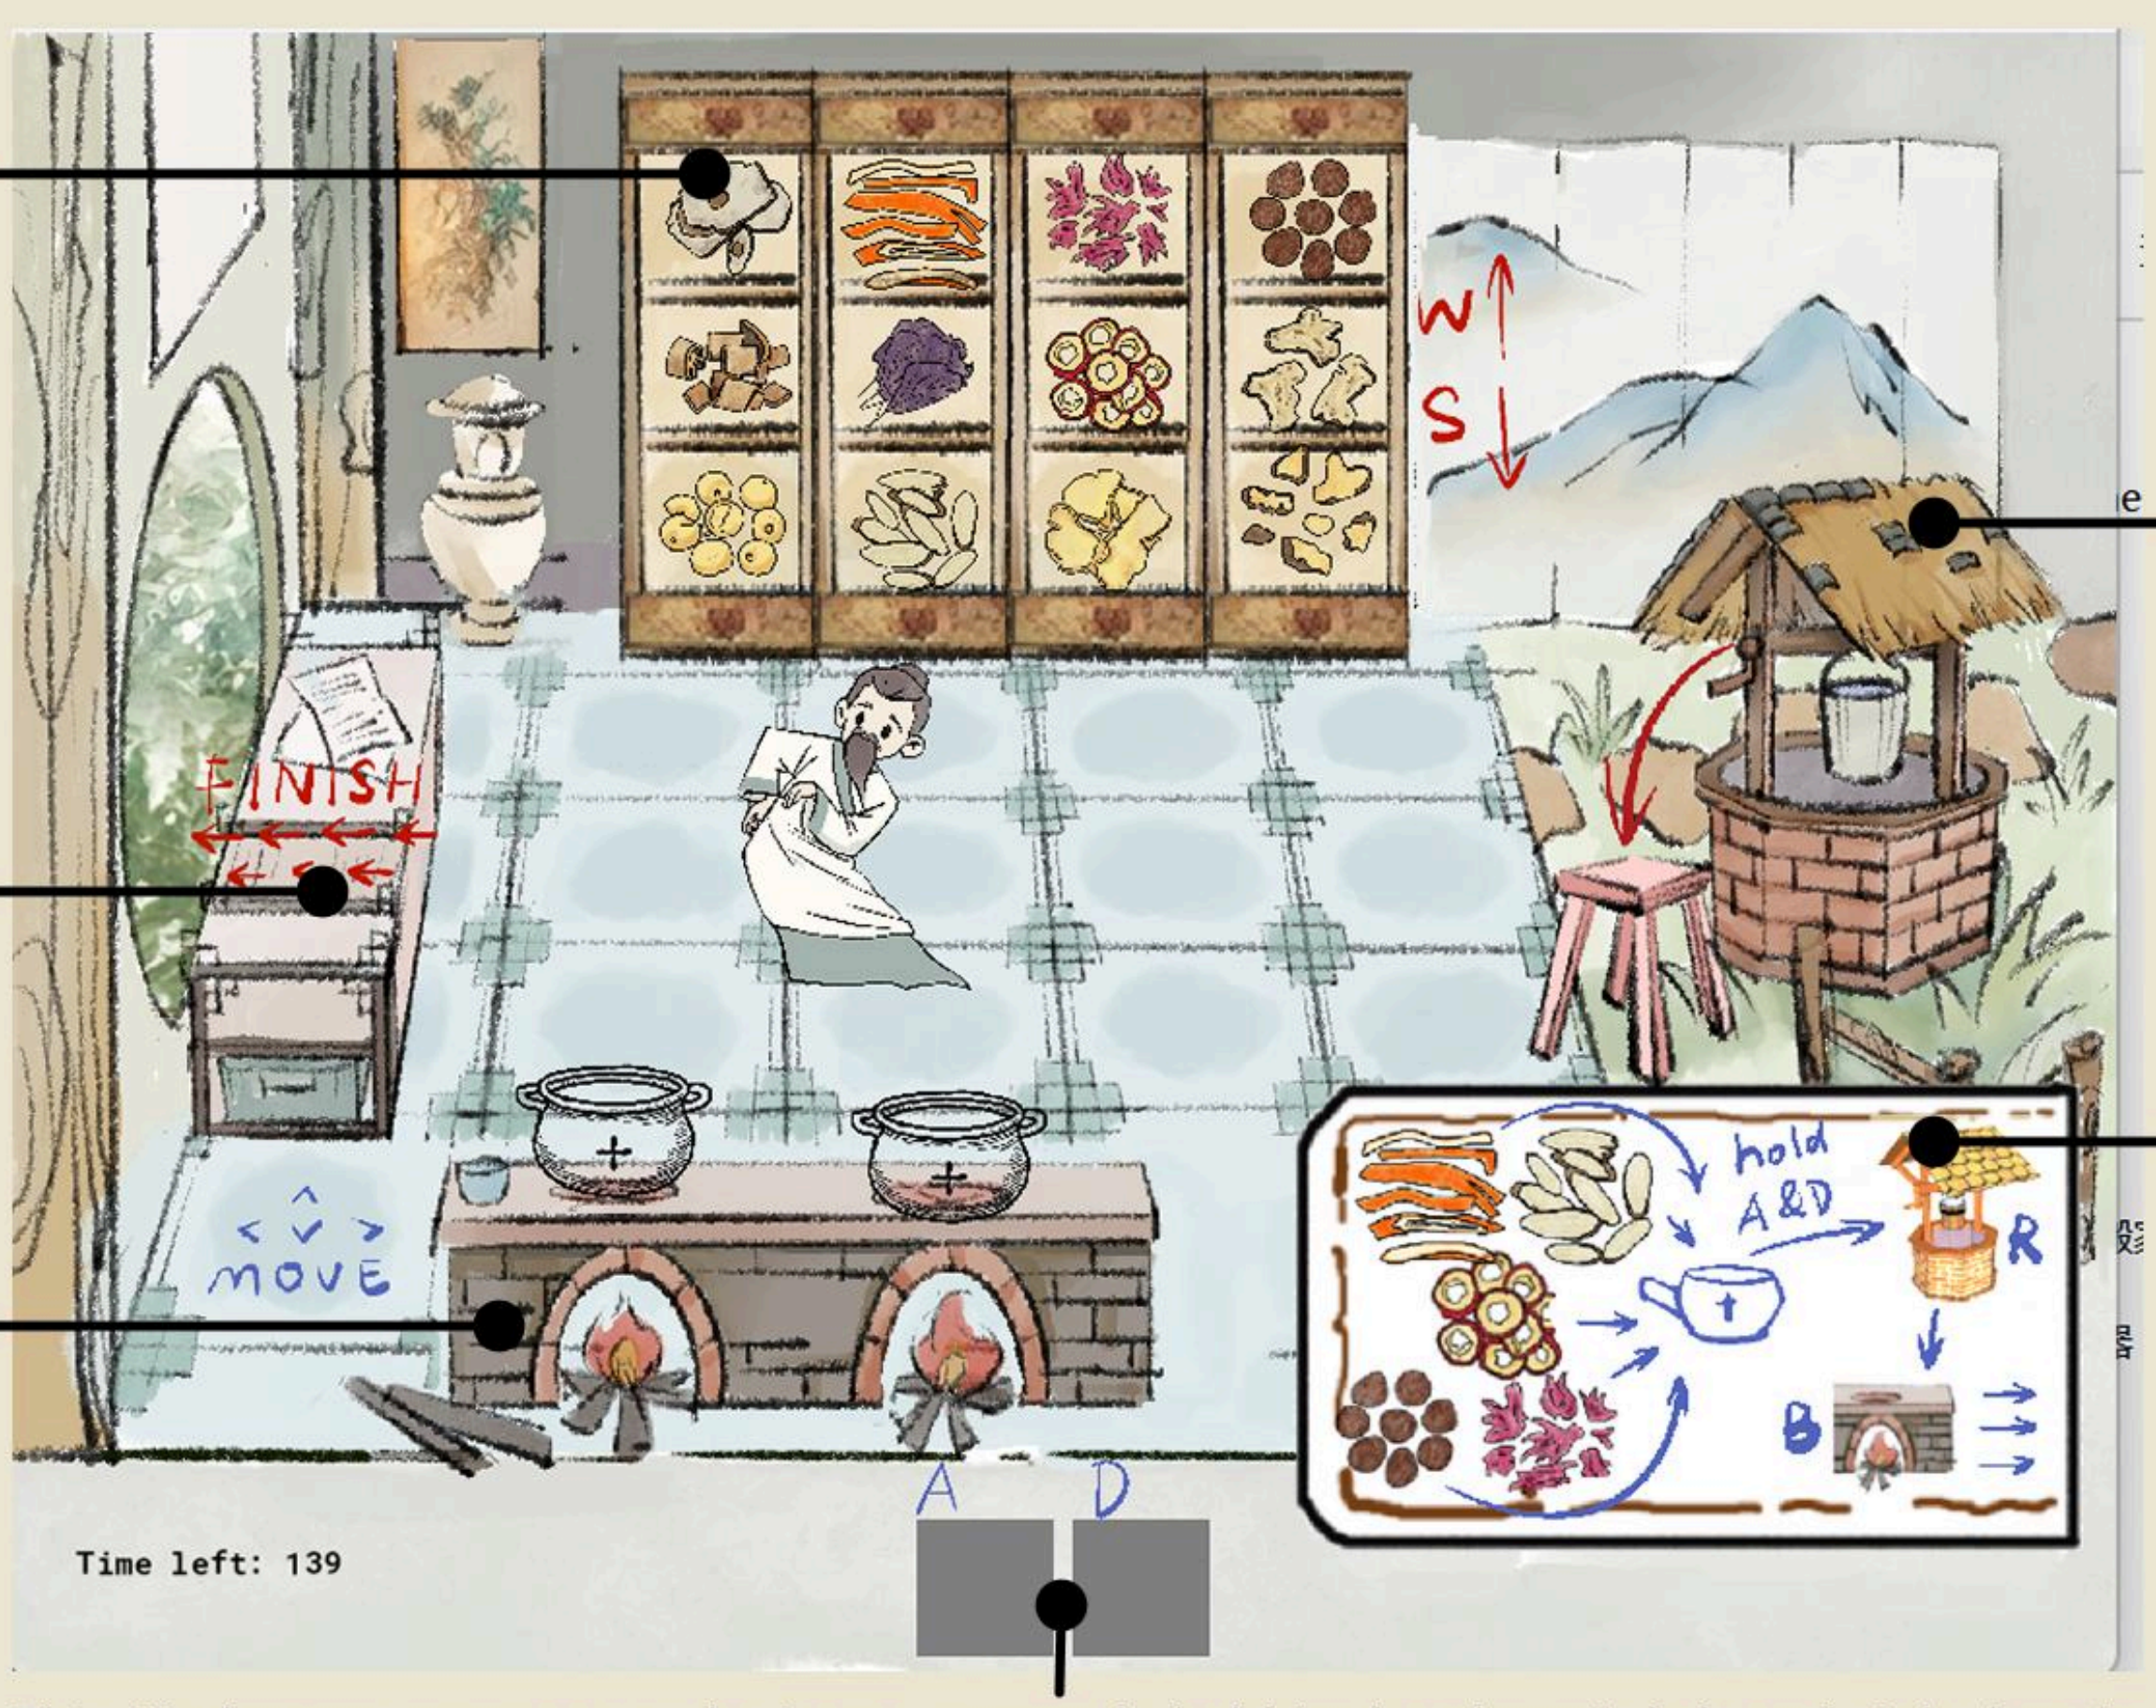
Overview

This game is designed as a practice-oriented experience for traditional Chinese medicine enthusiasts.
By transforming herbal prescriptions into an interactive gameplay loop, players learn and memorize formulas naturally through hands-on actions such as collecting ingredients, combining herbs, adding water, brewing, and serving in a relaxed and enjoyable environment.



The Herbal Cabinet stores and displays all available medicinal herbs.
Players retrieve the required ingredients here and combine them according to the prescription. As levels progress, more herbs become available, increasing memory load and decision pressure and encouraging players to become more familiar with each formula.

The Serving Counter is where completed herbal medicines are delivered to customers. Once a prescription is correctly prepared and brewed, players must place the medicine here to complete the order and receive feedback or rewards.

The Herbal Stove is the core workstation for brewing medicine, with Brewing Pots placed on top.
Players add prepared ingredients and water into the pot, then use the stove to brew the medicine until it is complete. Multiple pots allow players to handle several prescriptions at once, emphasizing time management and workflow planning.

This UI element represents the items currently held in the player's left and right hands. The left and right hands are mapped to the A and D keys respectively, requiring players to use the corresponding input when picking up or placing items, reinforcing a clear and intuitive dual-hand interaction system.

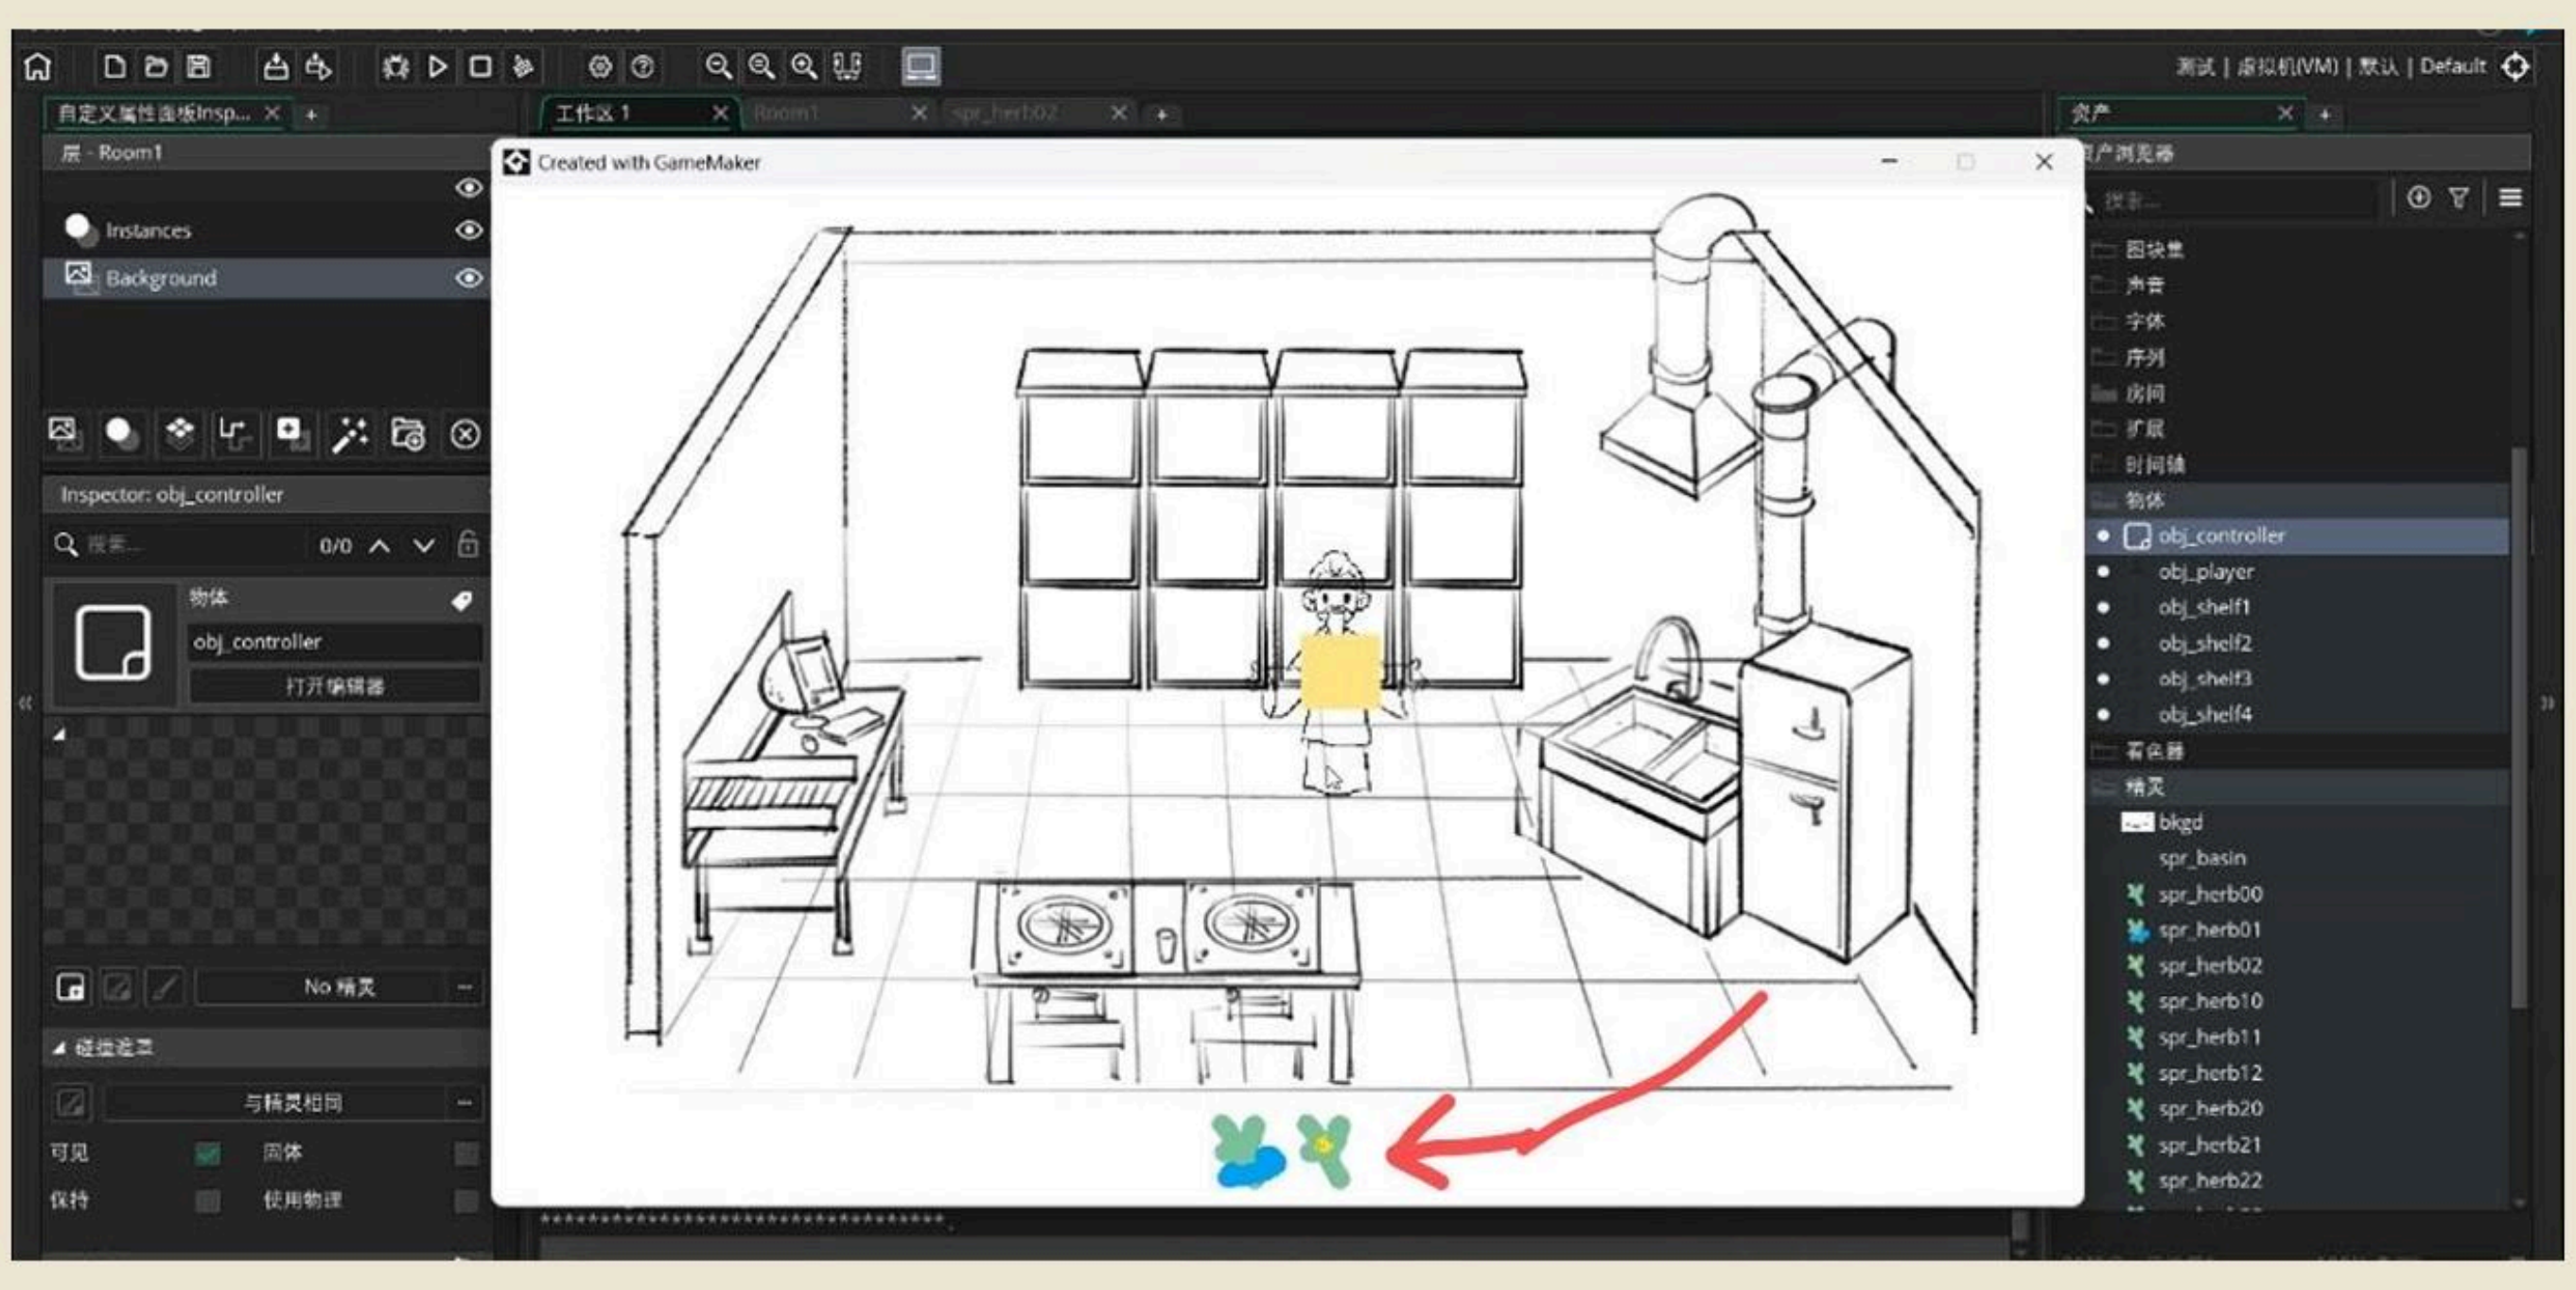
The Water Well is the interaction point where players collect water.
Before brewing can begin, water must be taken from the well and added to the pot. This step reinforces the correct preparation order and helps players learn the full herbal medicine workflow.

This interface presents ingredients and preparation steps using clear visual cues and arrows, allowing players to quickly understand and follow each recipe.

My contribution：

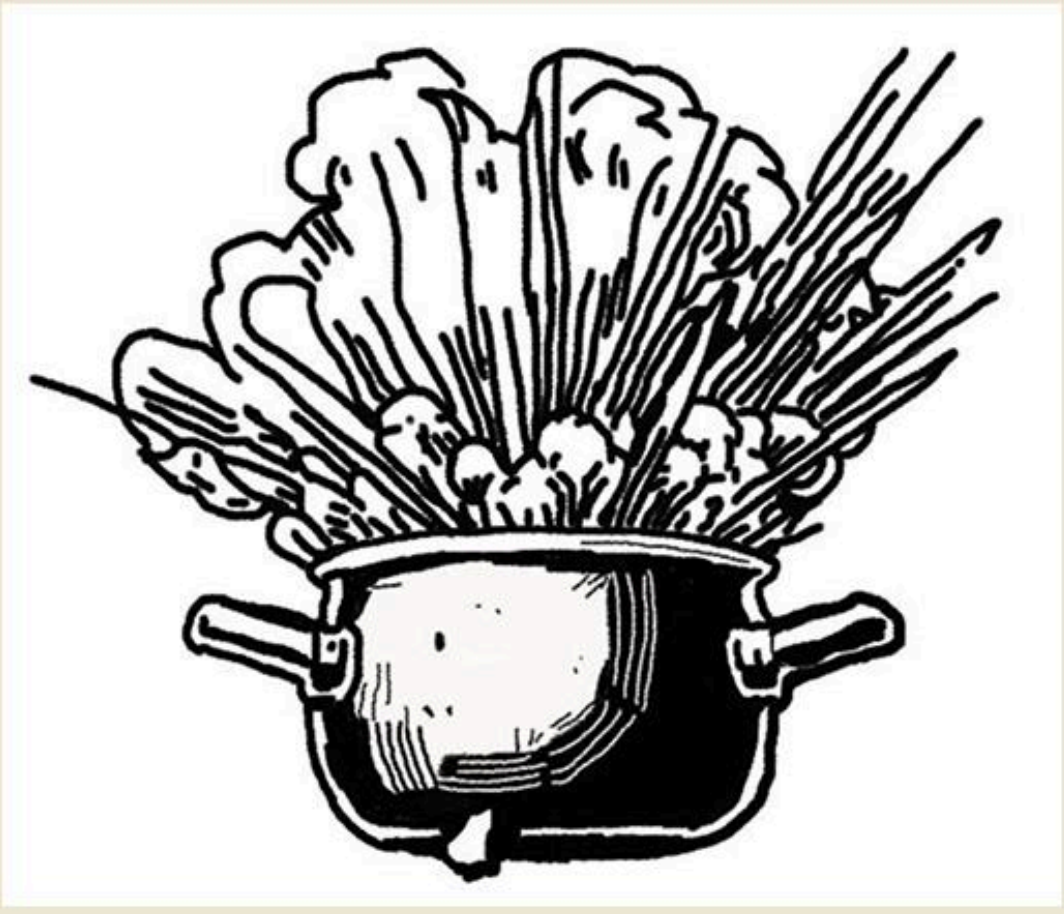
- **Game Mechanics**
- **Level Design**
- **2D Assets**

Level Design



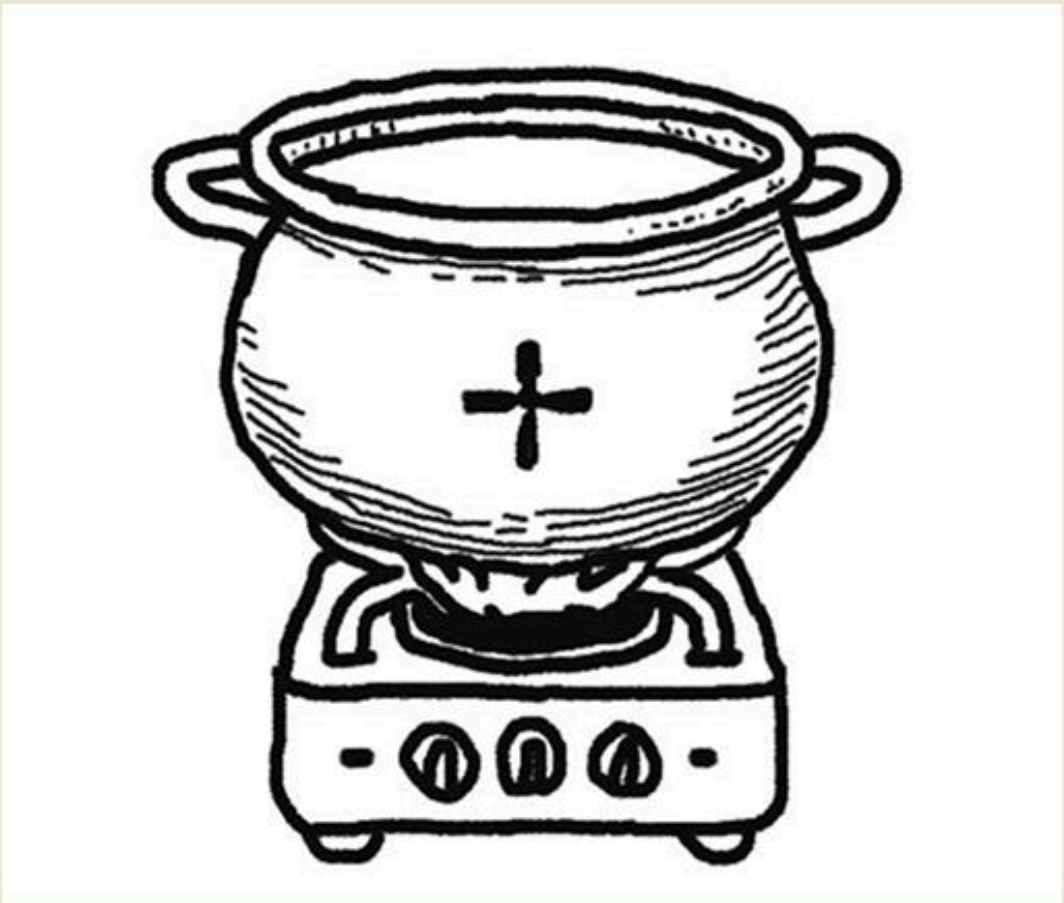
This level uses a single-room layout with clearly defined functional zones, keeping all core interactions within a controlled and readable space.
Key stations—such as the herbal cabinet, water source, stove, and serving area—are deliberately placed apart, encouraging constant movement during the preparation process.
The spatial layout is built around a complete production loop.
Players must travel between stations in sequence—collecting ingredients, adding water, brewing, and finally serving—turning repeated movement into a learning tool that reinforces process order and recipe memorization.
An open central area minimizes physical congestion, allowing players to focus on time management and workflow planning rather than navigation difficulty.

2D Assets



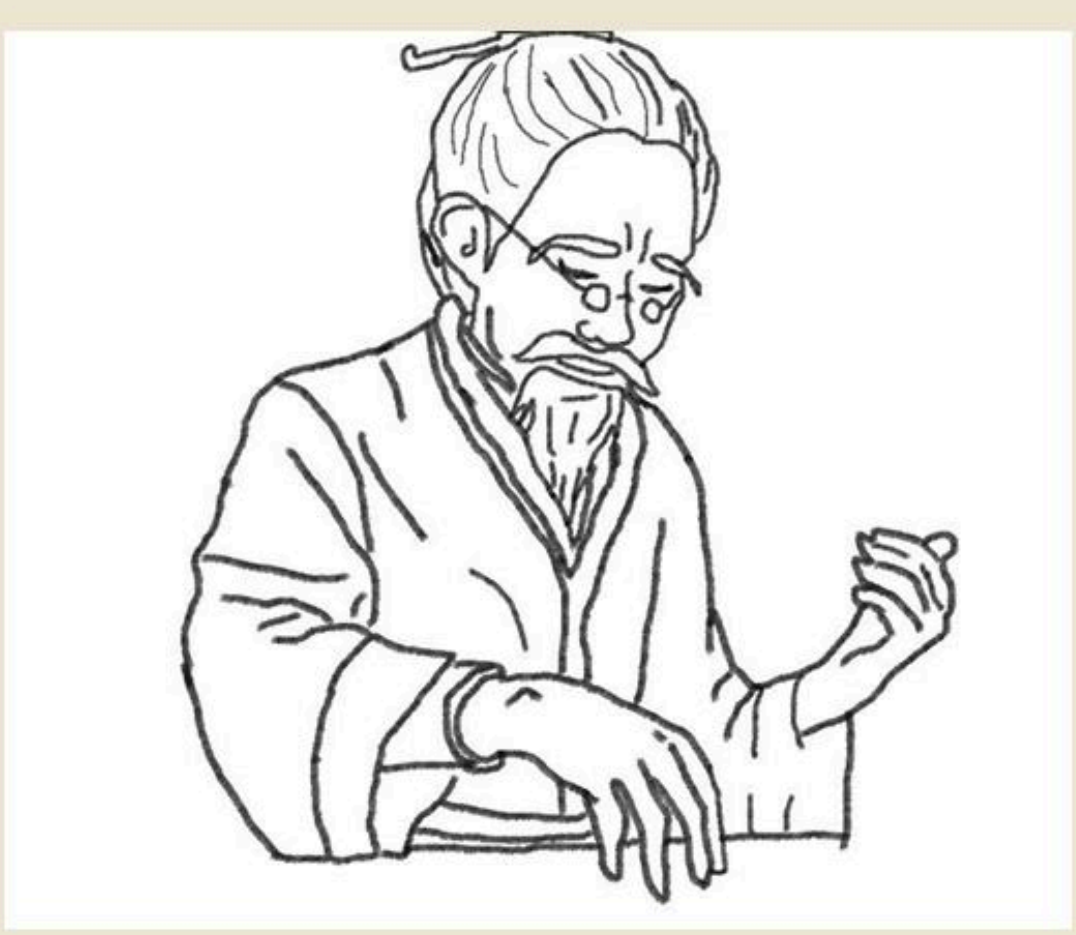
Pot Explosion

This visual effect represents a failure state caused by overcooking during the herbal brewing process.
By using an exaggerated explosion as feedback, the game clearly communicates the mistake while keeping the tone light and playful, helping players better understand and remember proper brewing timing.



Pot

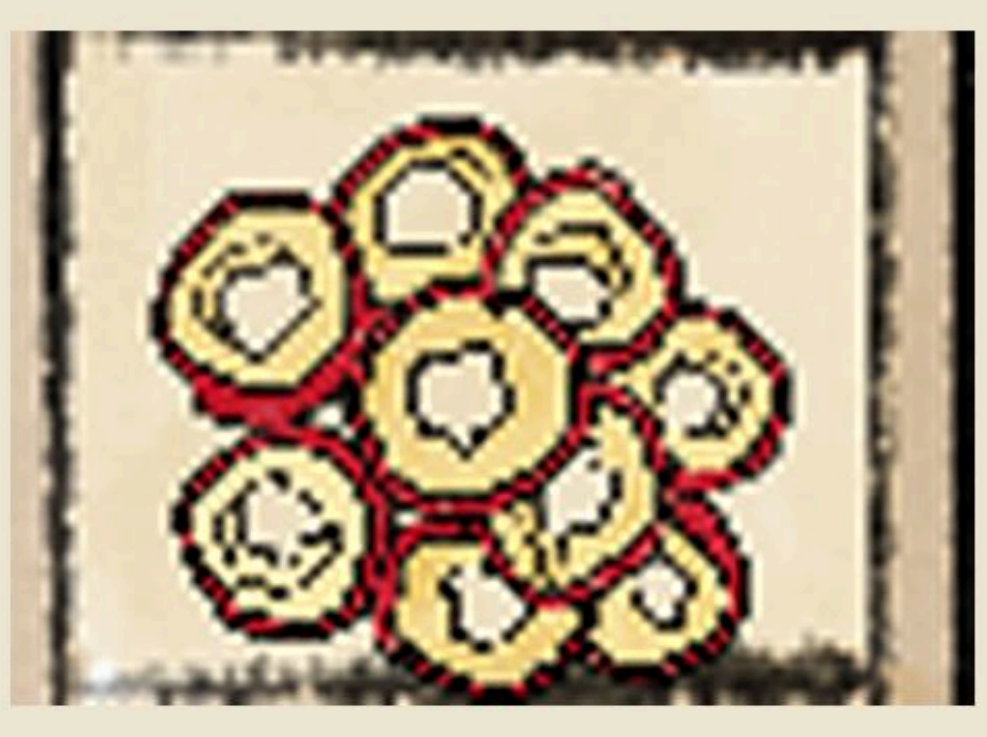
The brewing pot is the core interactive object in the herbal medicine workflow.
It visually represents the current brewing state and serves as the focal point where timing, preparation, and player decision-making converge.

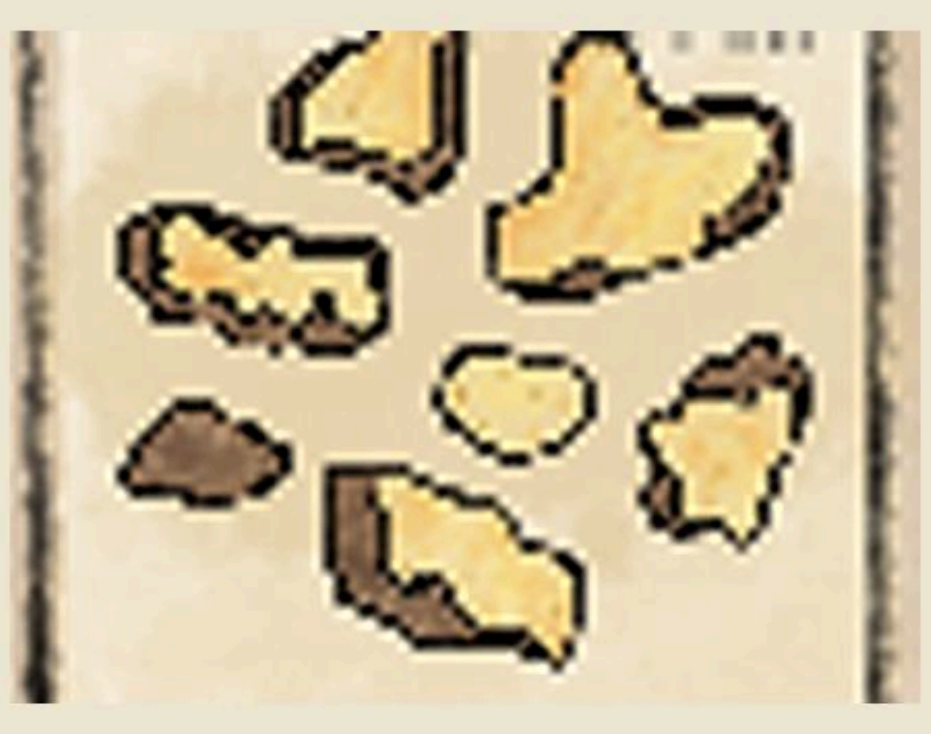


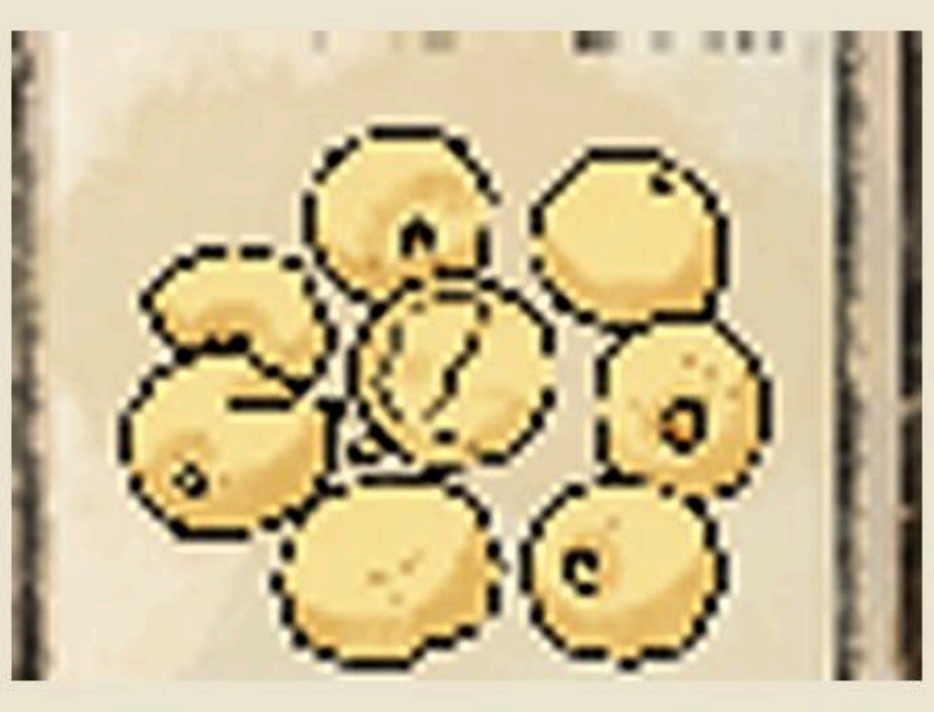
Concept Art

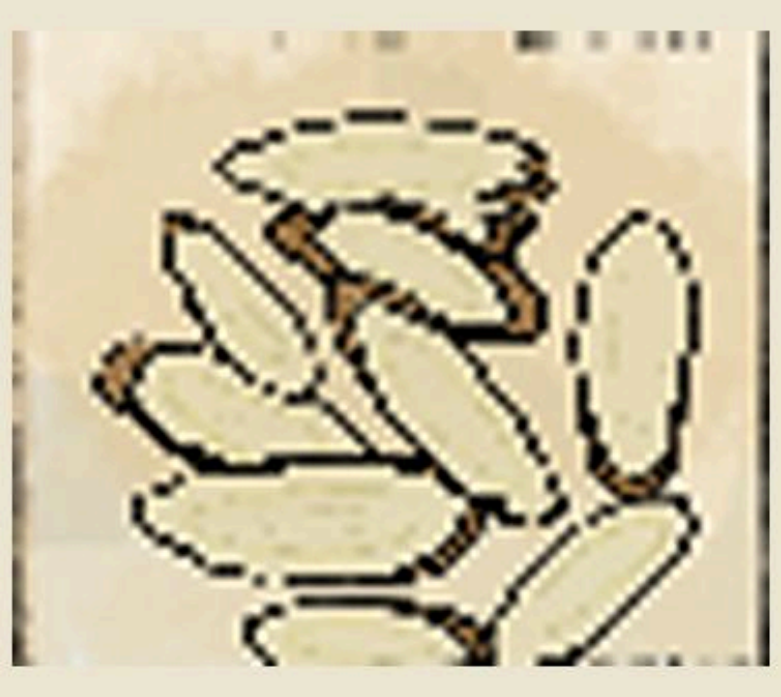
This concept art defines the game's overall visual tone and character identity.
Using hand-drawn line work and restrained character design, it conveys the calm and focused nature of a herbal practitioner, helping establish a warm and trustworthy atmosphere for the experience.

2D Assets









Herbal Ingredients

Herbal ingredients are the fundamental building blocks of all recipes in the game.
Each ingredient is designed with distinct silhouettes and color cues, allowing players to quickly recognize them during fast-paced interactions. Through repeated collection and combination, players build visual memory and associate specific ingredients with their corresponding recipes.
Beyond gameplay, the ingredient system supports learning by shifting memorization away from rote recall toward hands-on interaction and visual reinforcement.
