Group Project

Link: Dinos TD on Steam

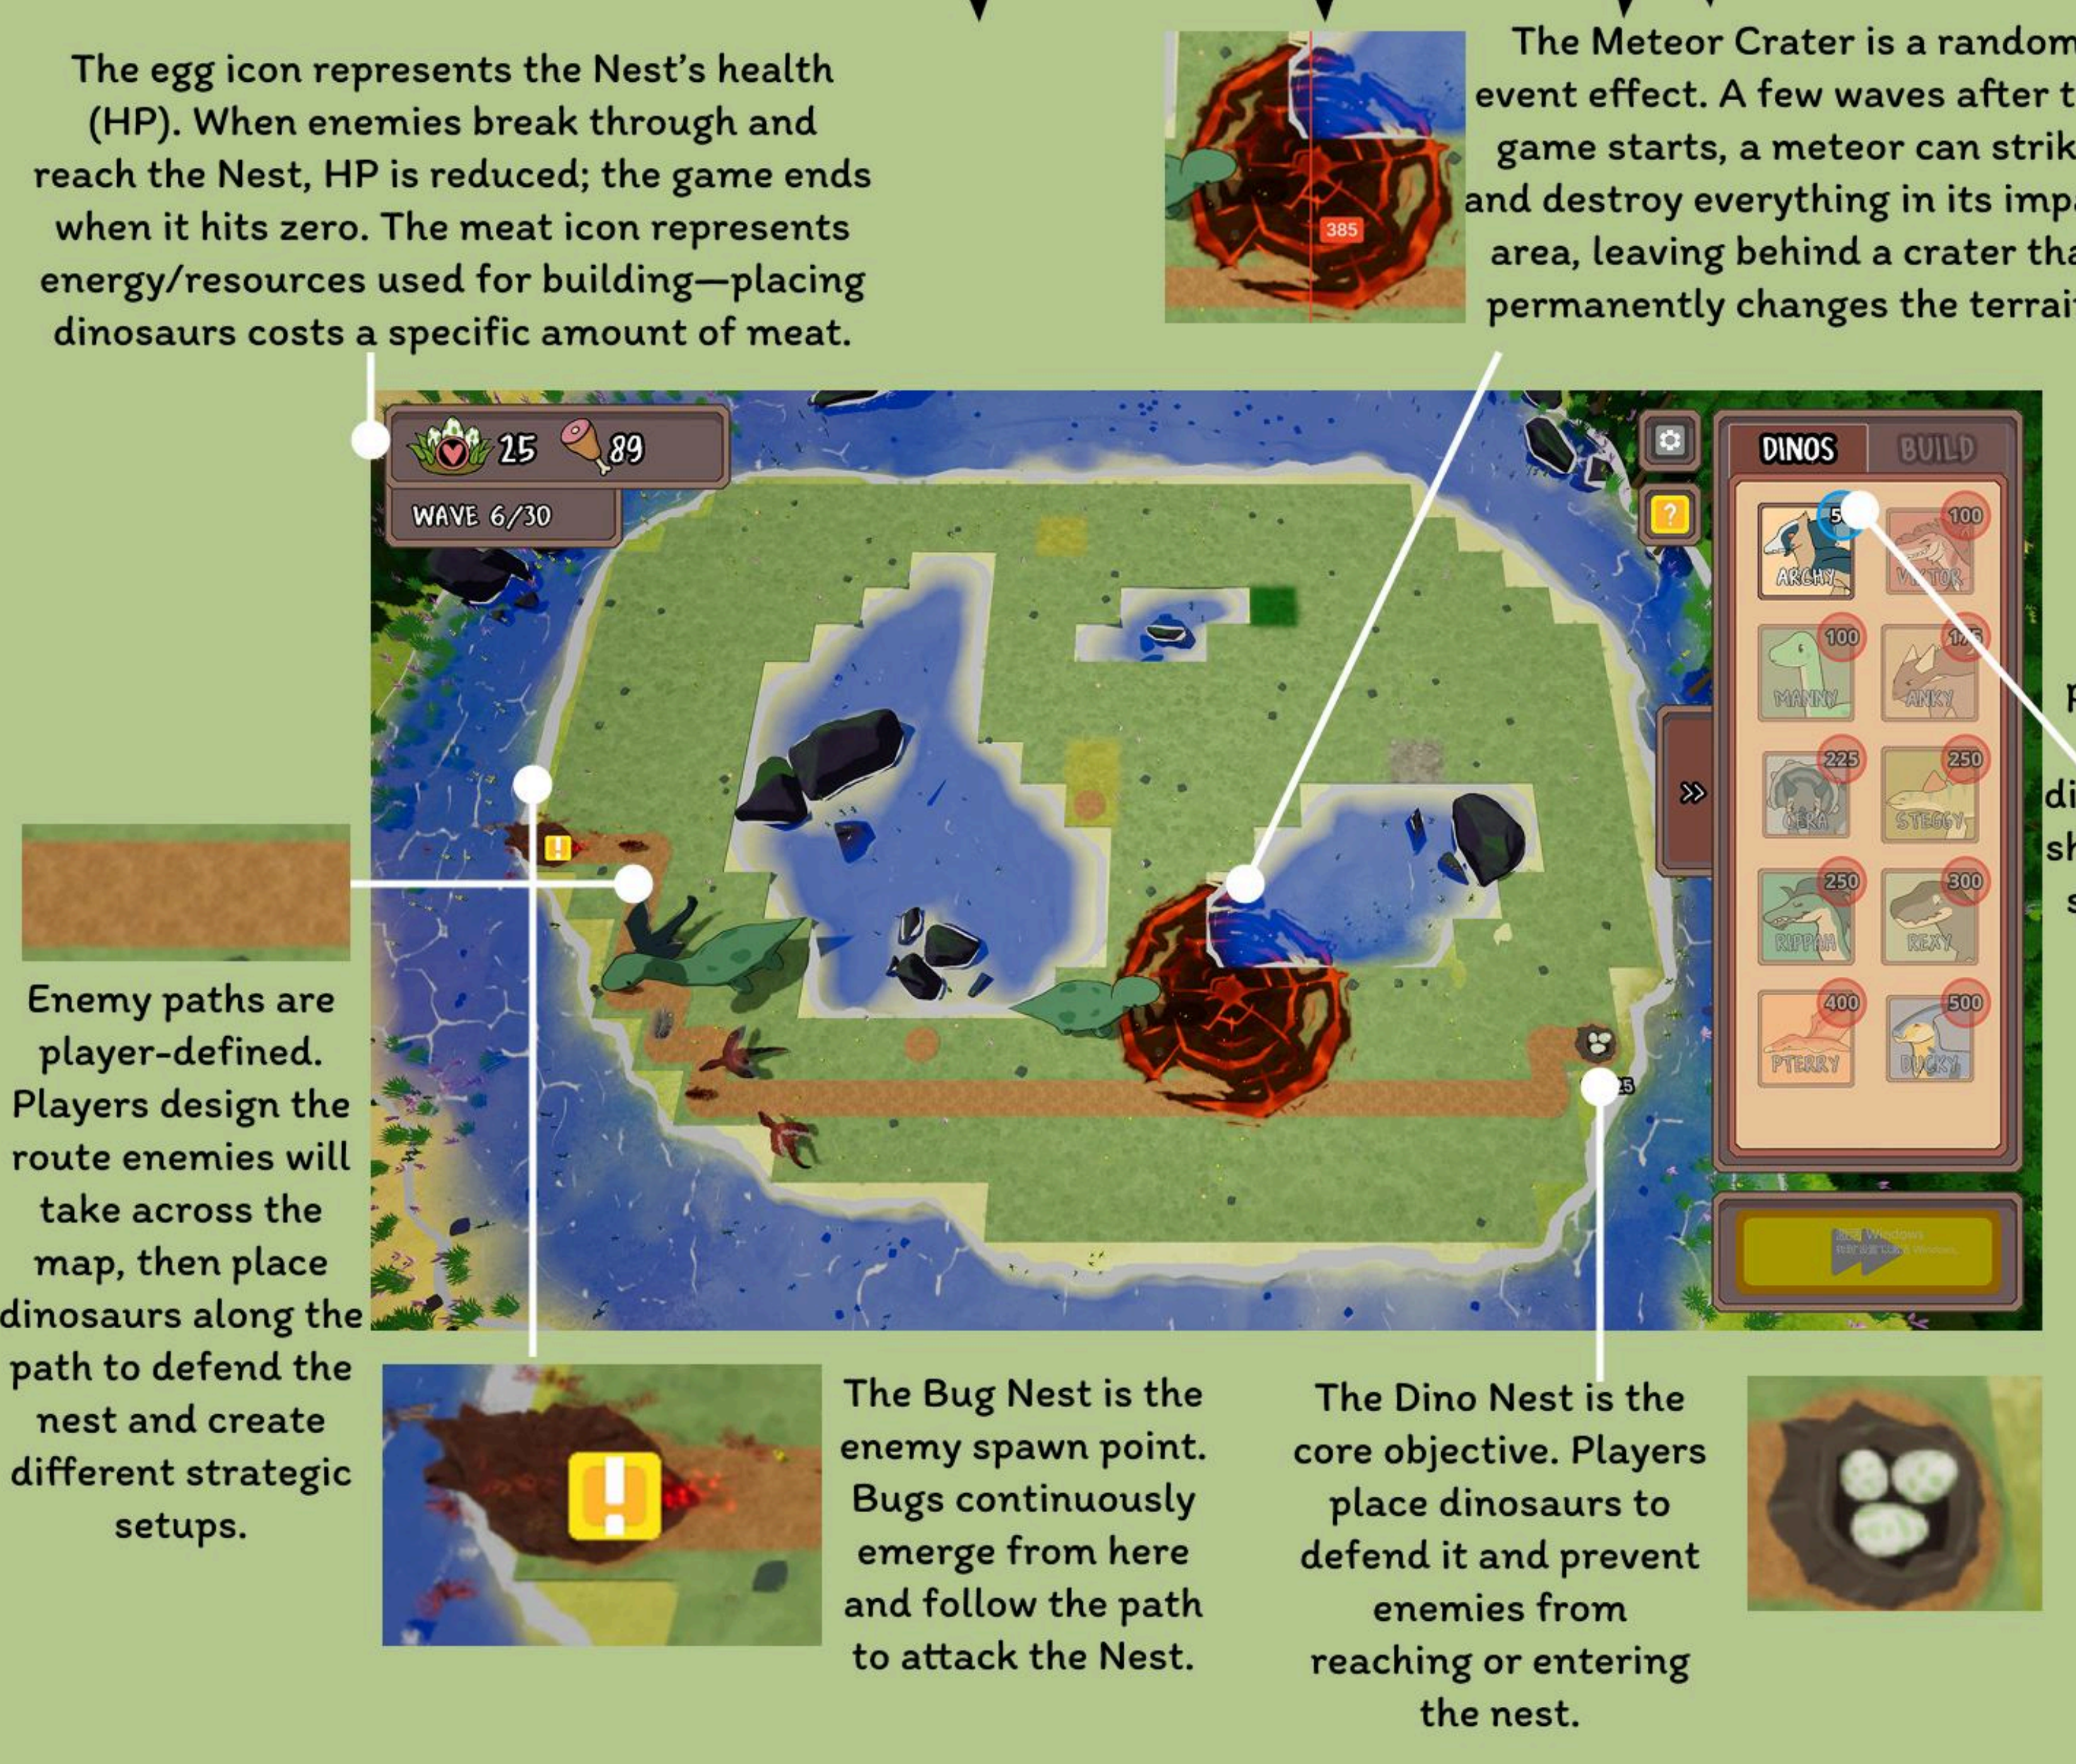
Game Introduction

Dino TD is a tower defense game where players protect their Nest by placing dinosaurs to stop waves of bugs spawning from the Bug Nest. A key feature is player-designed paths—you shape the enemy route with path tiles, then build defenses along it for optimal coverage. The game also includes dynamic events like meteor strikes that wipe out everything in an area and leave a permanent crater, pushing players to adapt their strategy on the fly.

My Contribution:

- Game Mechanics
- Level Design
- 3D Moldes

Overview



The egg icon represents the Nest's health (HP). When enemies break through and reach the Nest, HP is reduced; the game ends when it hits zero. The meat icon represents energy/resources used for building—placing dinosaurs costs a specific amount of meat.

The Meteor Crater is a random event effect. A few waves after the game starts, a meteor can strike and destroy everything in its impact area, leaving behind a crater that permanently changes the terrain.

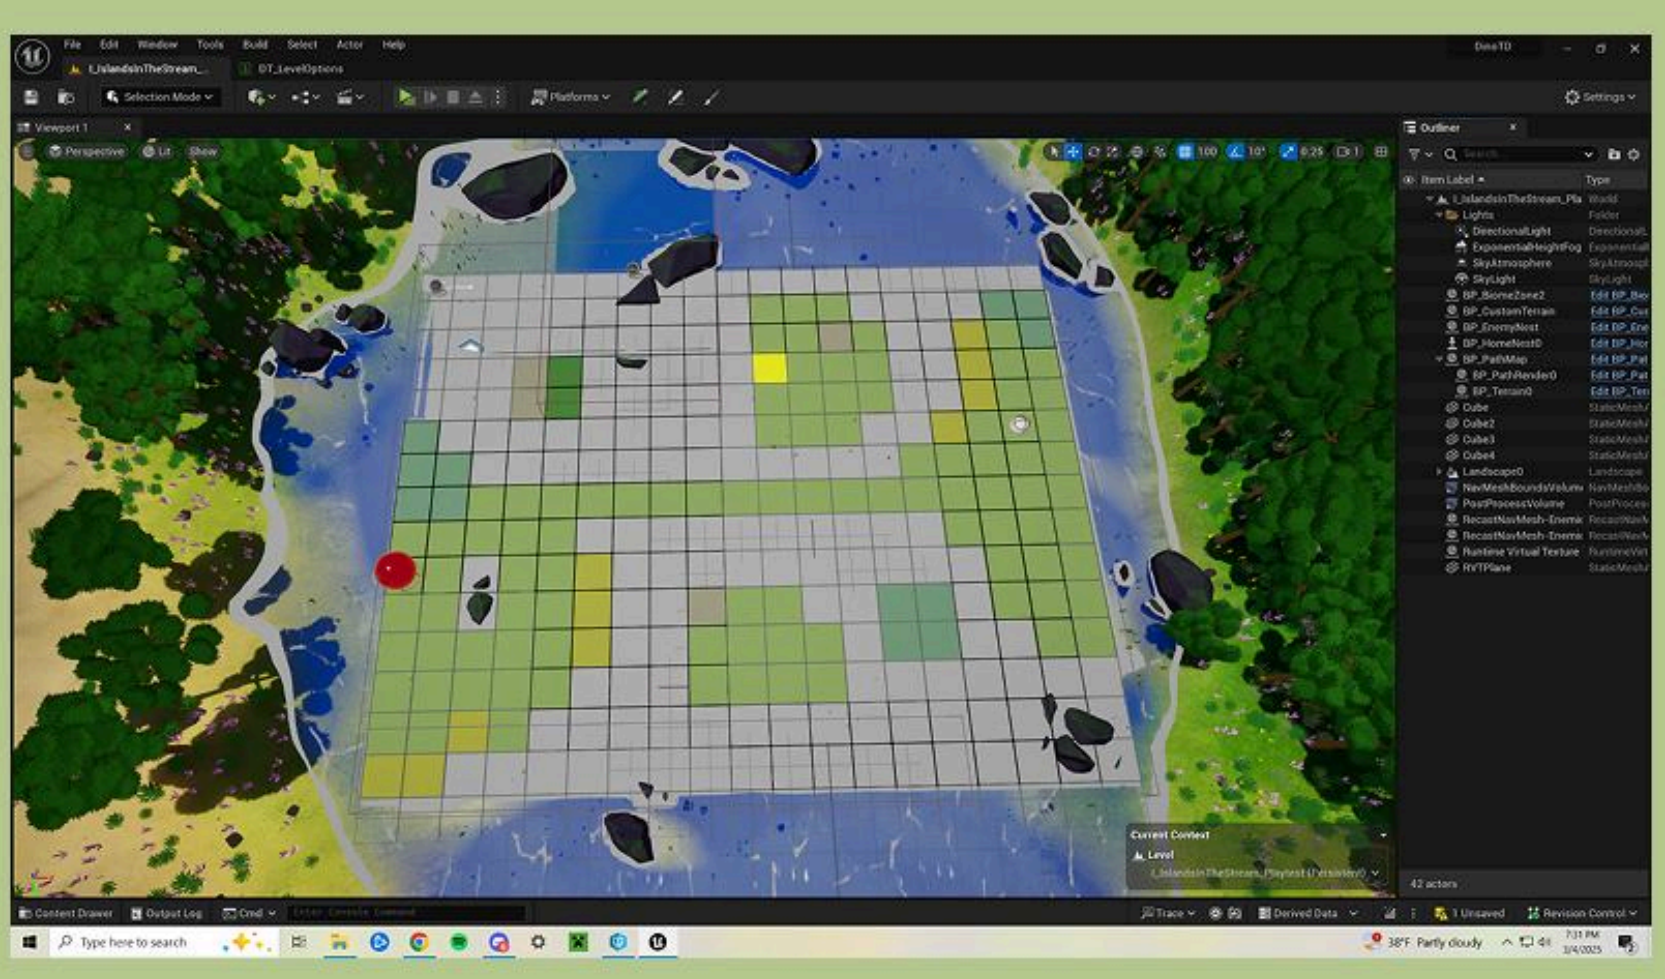
The Build Menu lets players choose what to place. It includes dinosaurs, path tiles that shape enemy routes, and special tiles that boost dinosaur stats.

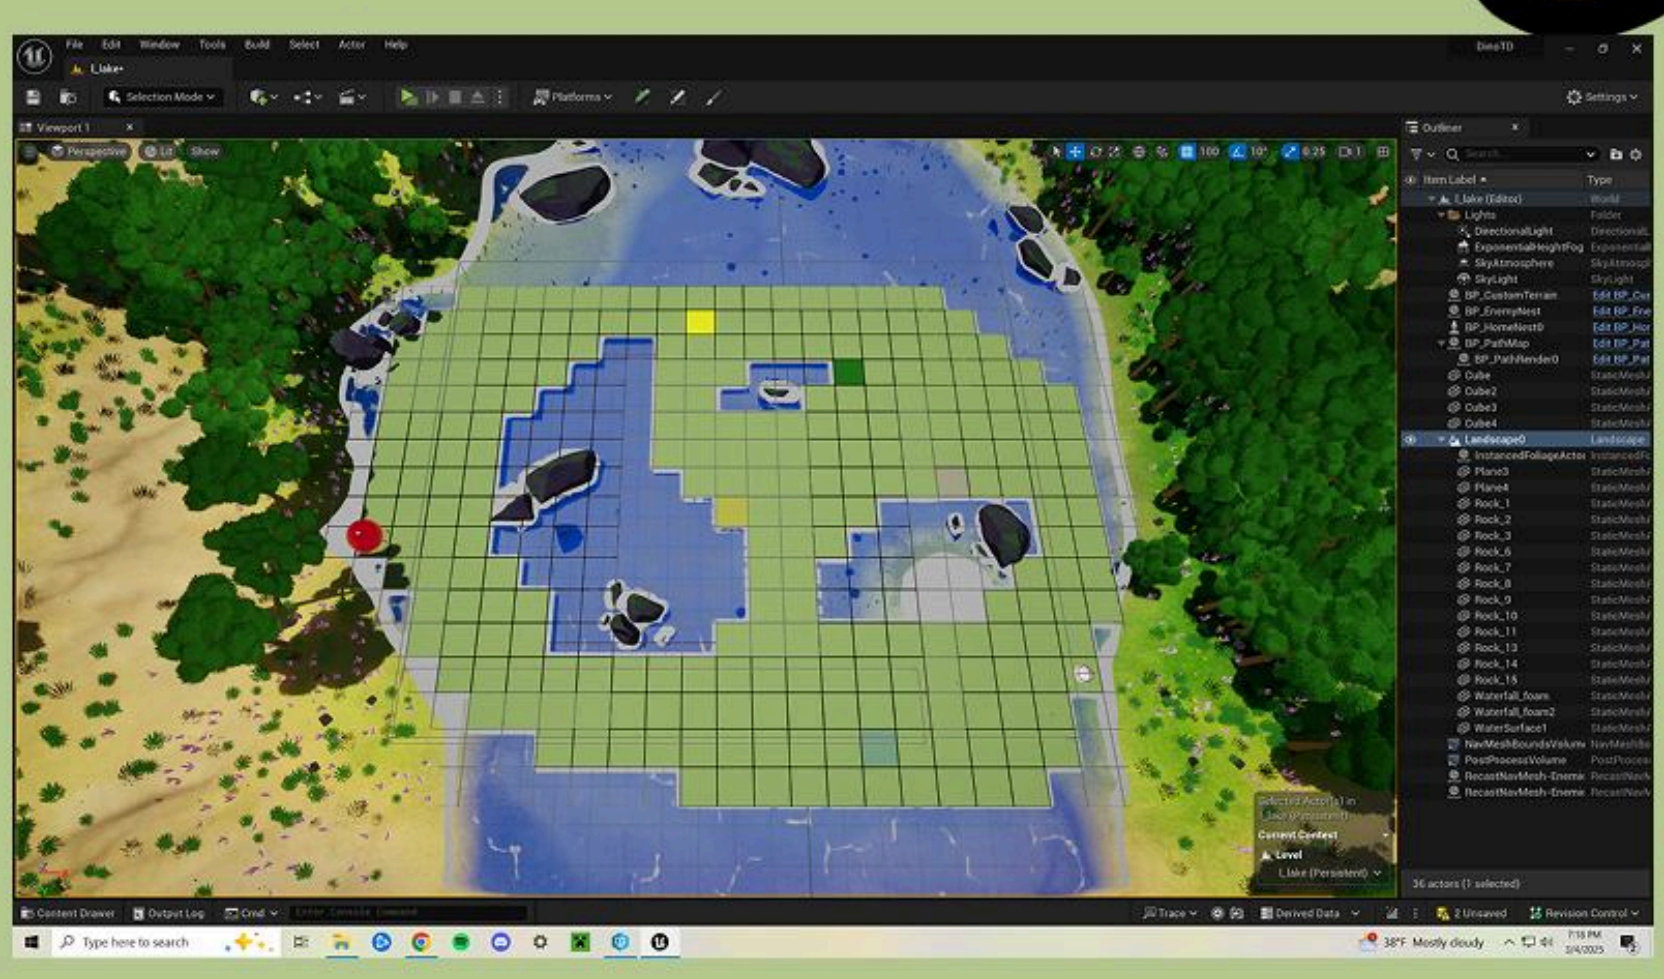
Enemy paths are player-defined. Players design the route enemies will take across the map, then place dinosaurs along the path to defend the nest and create different strategic setups.

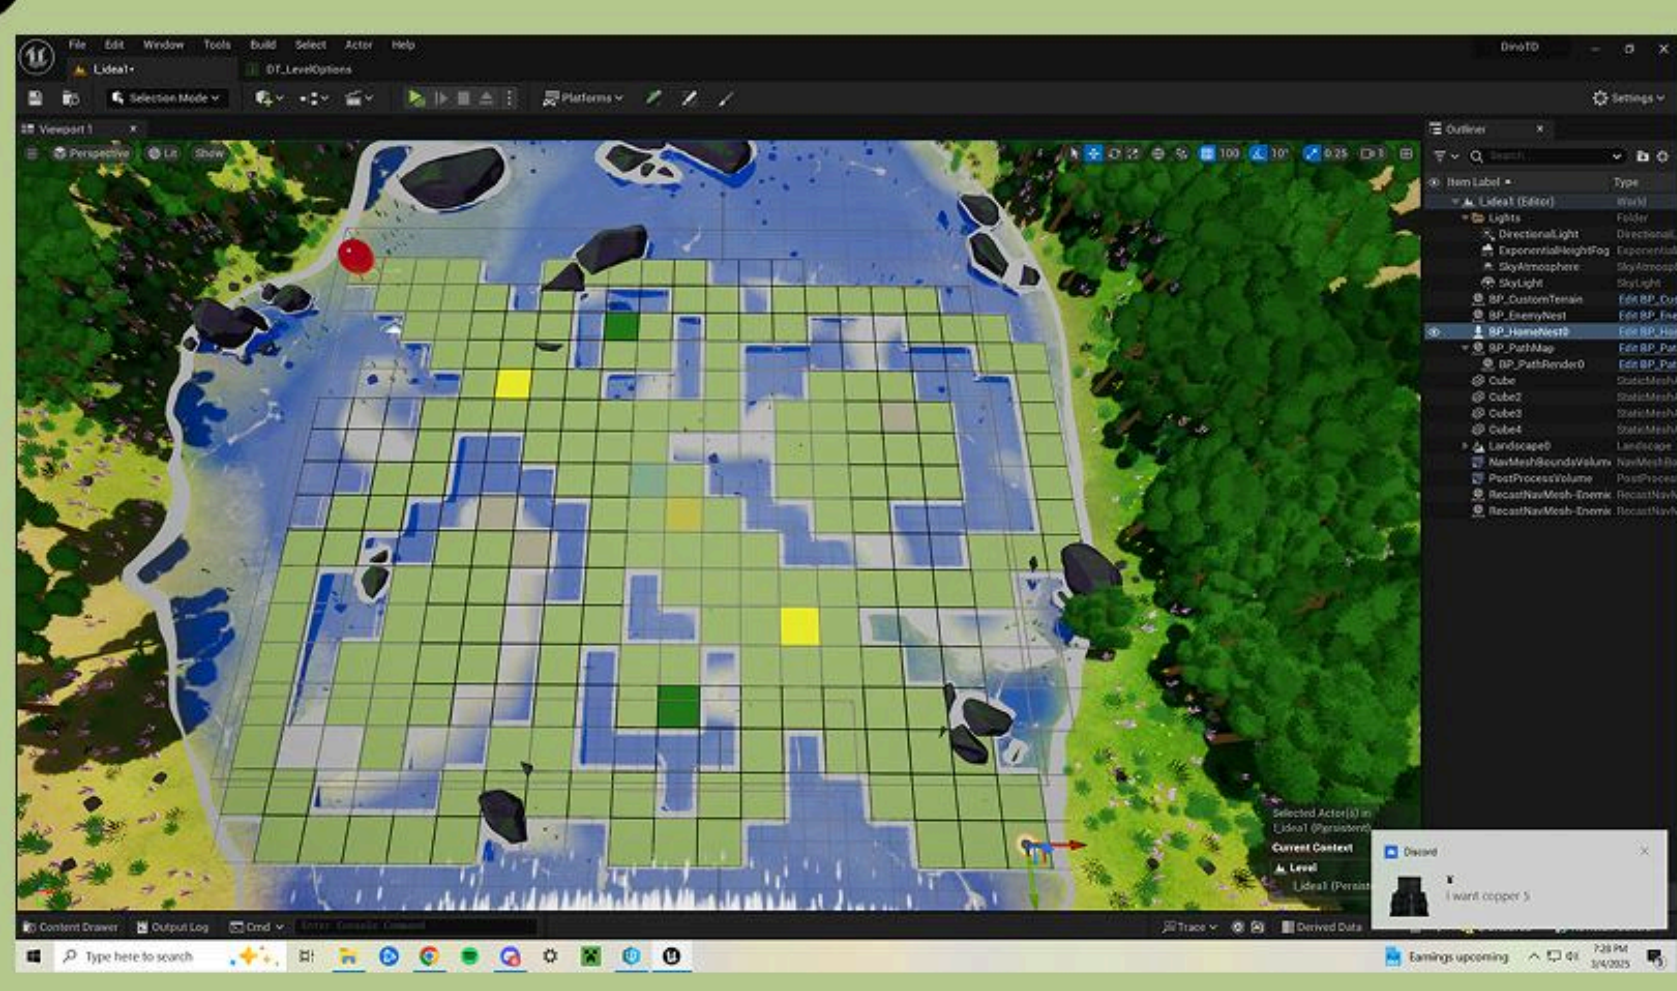
The Bug Nest is the enemy spawn point. Bugs continuously emerge from here and follow the path to attack the Nest.

The Dino Nest is the core objective. Players place dinosaurs to defend it and prevent enemies from reaching or entering the nest.

Level Design







Islands in the Stream

This level uses an island-and-bridge layout to limit routing freedom in a meaningful way. The long narrow connector creates natural chokepoints that reward concentrated defenses, while off-route special tiles encourage risk–reward detours. A relatively open area near the Nest supports a fallback line, keeping the level recoverable even when the frontline plan breaks.

Lakes

This level is built as an open, readable sandbox to teach and reward player-defined paths. Large water bodies act as soft barriers that naturally create corners and chokepoints, ensuring strong tower-defense moments even with free routing. The open mid-area encourages players to experiment with longer routes for more damage uptime, while the clean finish-side space provides a forgiving fallback for rebuilding. Scattered special tiles pull players into risk–reward routing decisions, improving variety across runs.

Lucky Clover

This level is built around open space to highlight the player-defined path mechanic. Two major water areas act as soft constraints, naturally creating corners and edge lanes that reward strong defense placement. The central area encourages a trade-off between longer routes for more damage uptime and the higher cost of spreading defenses. A clean finish-side zone provides a forgiving fallback, improving recoverability and adaptability.

3D Models

Dead Tree Stump

The Dead Tree is a decorative environment prop that adds silhouette and visual variety to the level, reinforcing the natural island theme while providing a clear landmark to help players read paths and buildable spaces.

Dinosaur Egg

The Dinosaur Egg is an environmental prop that reinforces the nest-and-hatching theme, adding light storytelling and visual identity so players immediately associate the area with dinosaurs and protection.

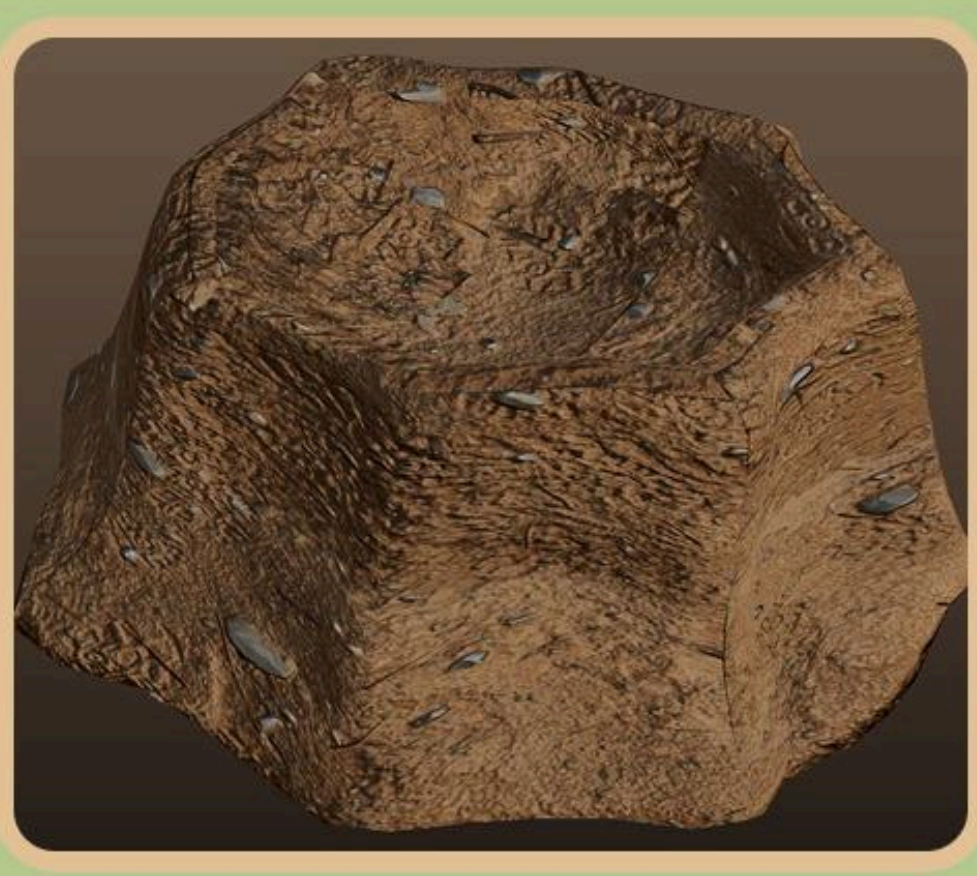
Dinosaur Bone

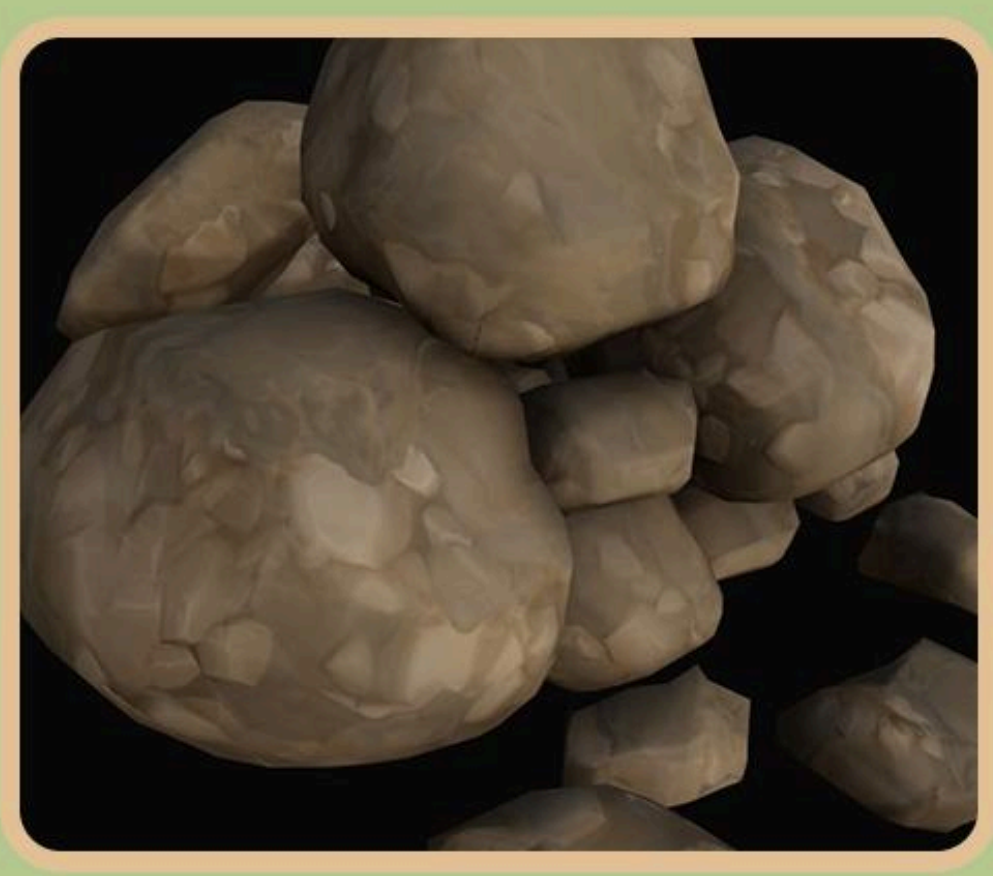
The Dinosaur Bone is a visual drop spawned when a dinosaur dies. It provides clear combat feedback and persistent "battlefield traces," helping players immediately read losses and pressure while adding atmosphere and immersion.

Meteor

The Meteor is a dynamic event prop that can strike a few waves into the game, destroying units and tiles within its impact area. It forces players to adapt their pathing and defense layout, adding tension and strategic variety.

3D Models





Dinosaur Nest

The Dinosaur Nest is a key thematic prop that reinforces the game's core objective—protecting the nest—while also serving as a clear landmark to help players quickly identify the defense focus and important areas on the map.

Rock Projectile

The Thrown Rock Projectile is a visual projectile used for dinosaur attacks. It clearly communicates ranged/arc attacks and impact timing, helping players read attack direction, coverage, and hit feedback at a glance.

Meteor Fragment

The Meteor Fragment is an environmental debris prop spawned after a meteor strike. It enhances the sense of impact and aftermath, helps players quickly identify the affected area, and strengthens the event's visual feedback.

Bug Nest

The Bug Nest is the enemy spawn point where bugs continuously emerge to begin their attack. As a clear start landmark, it helps players identify the threat source and plan pathing and early defense placement.
