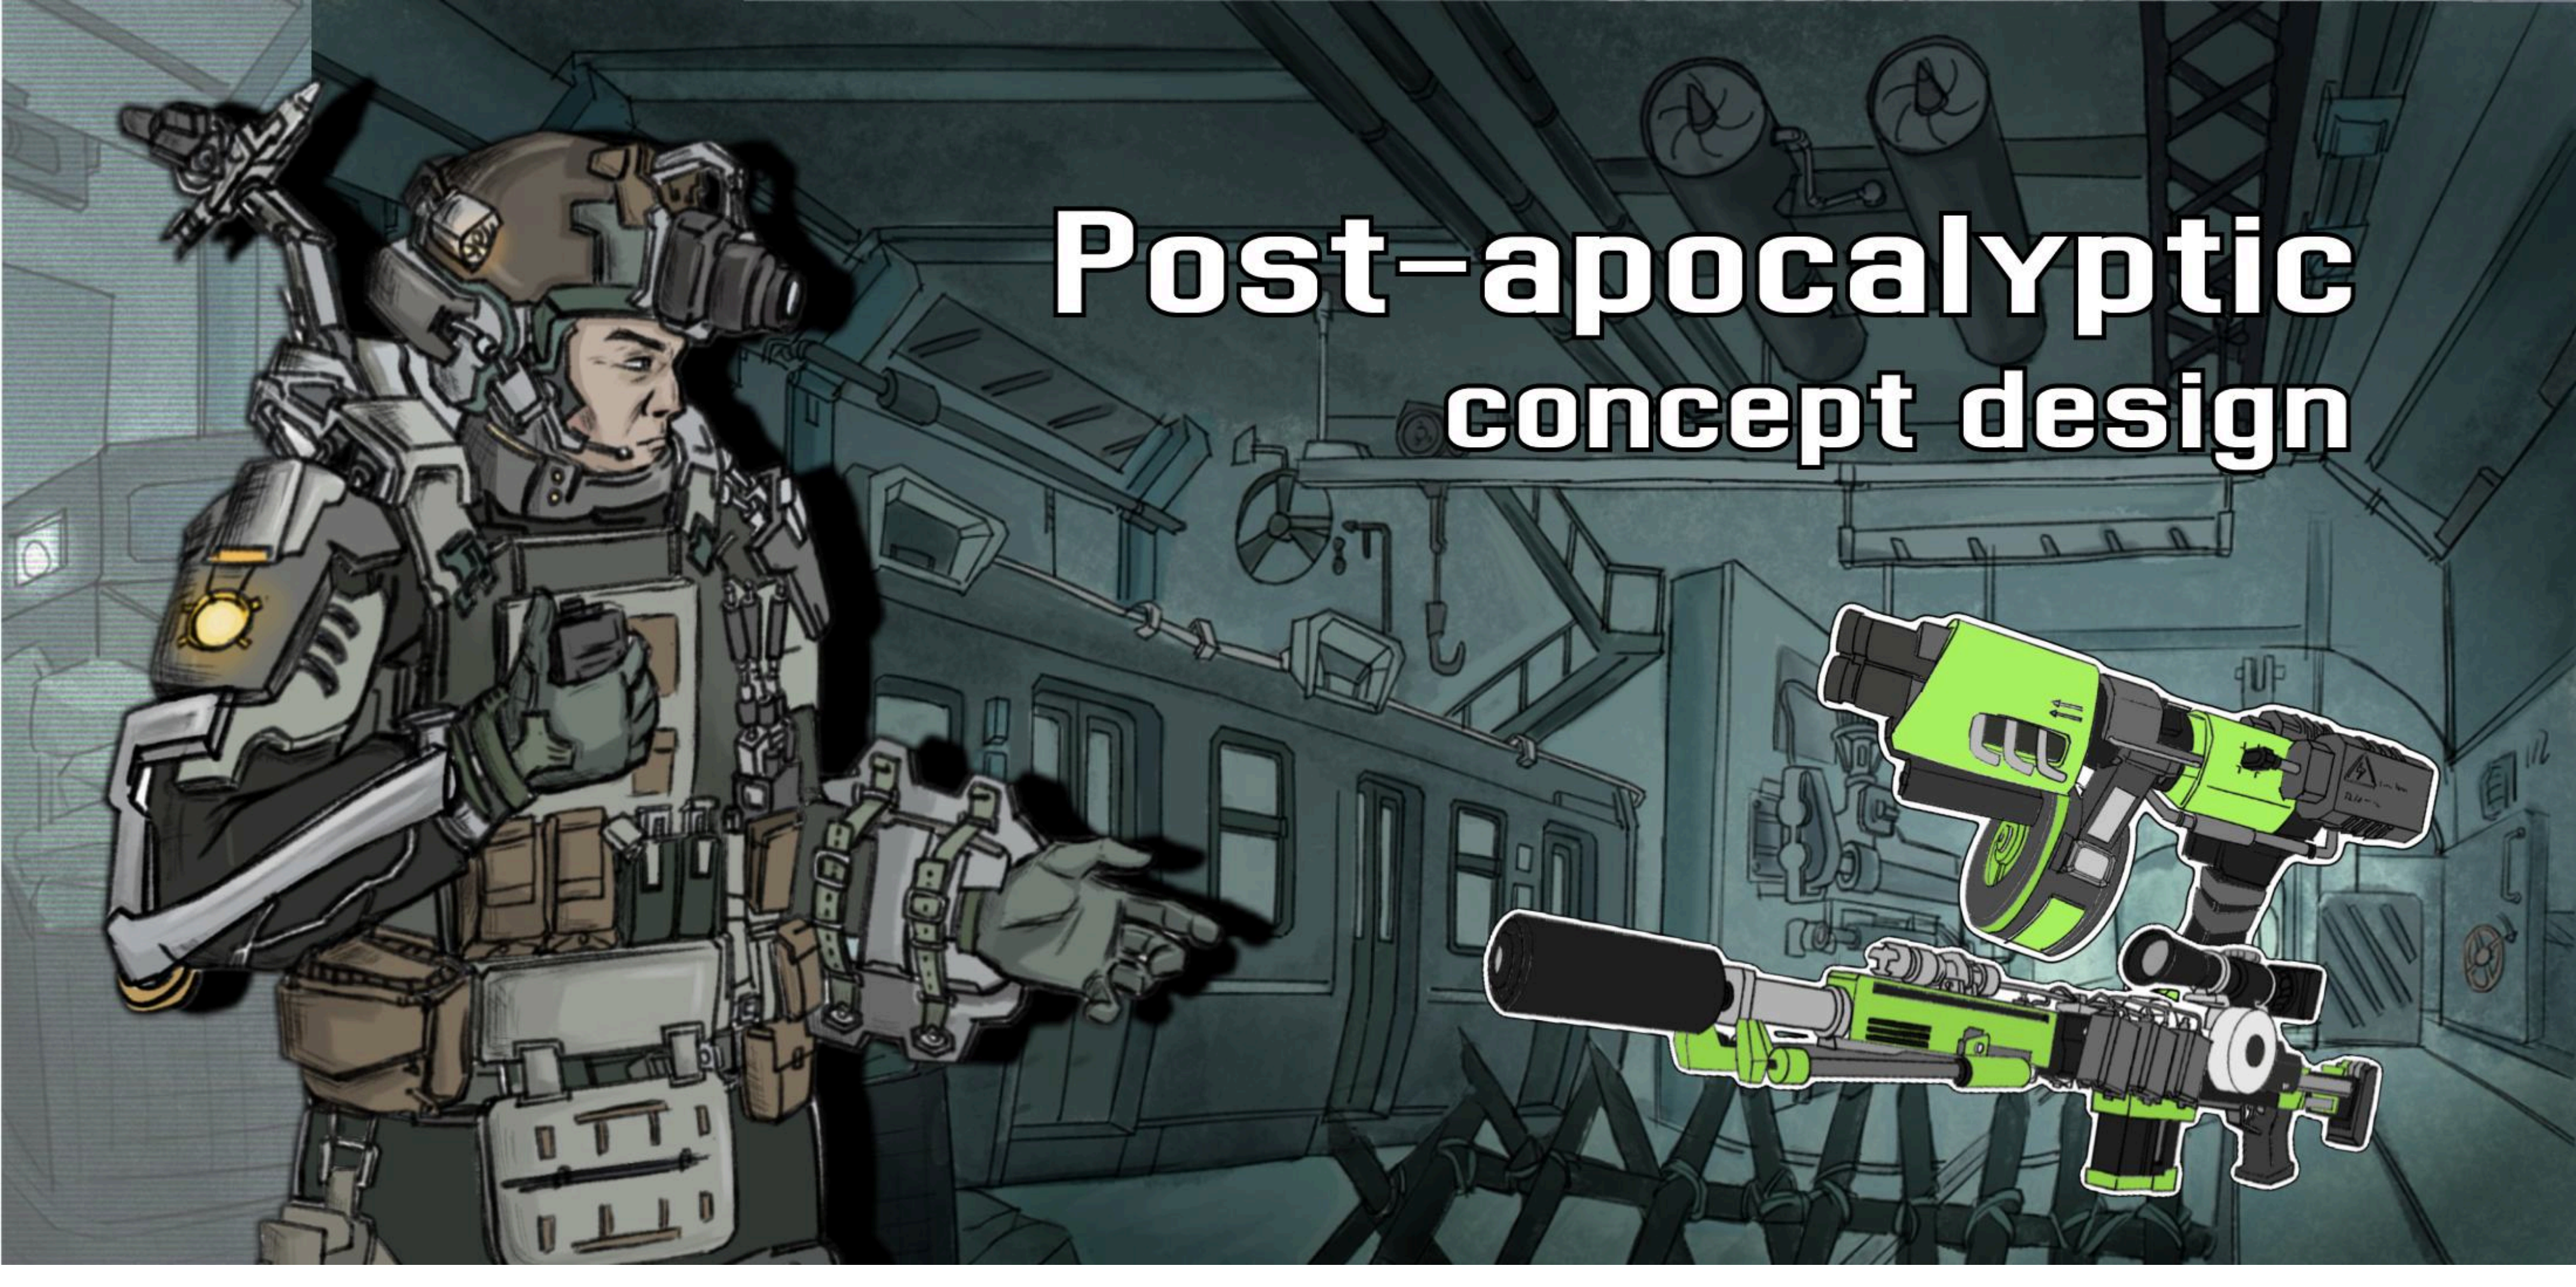
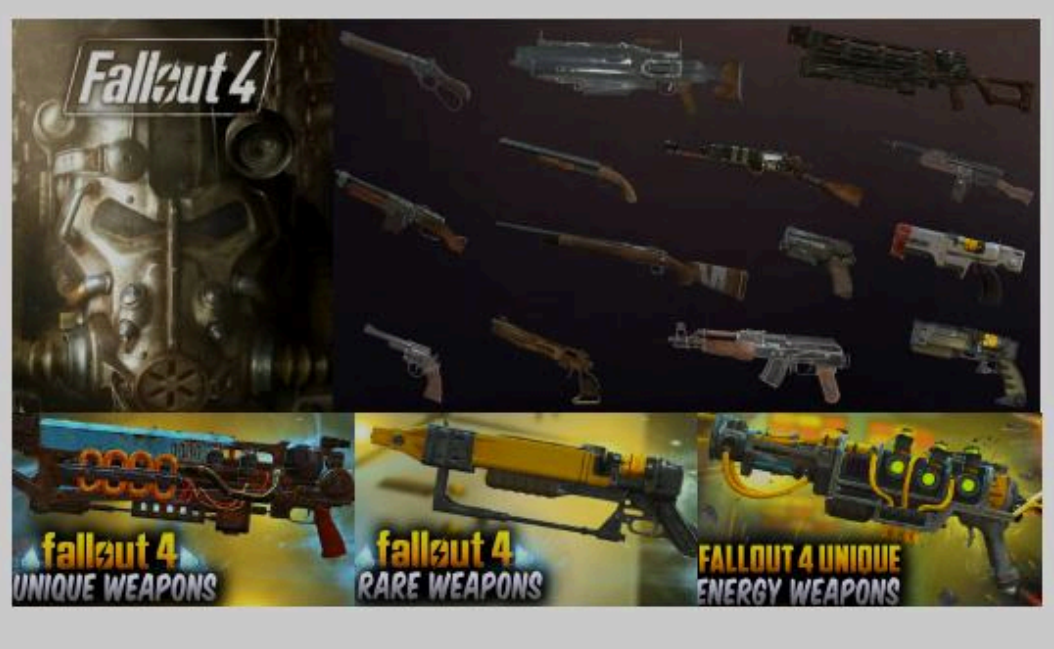
Post-apocalyptic concept design



WEAPON DESIGN

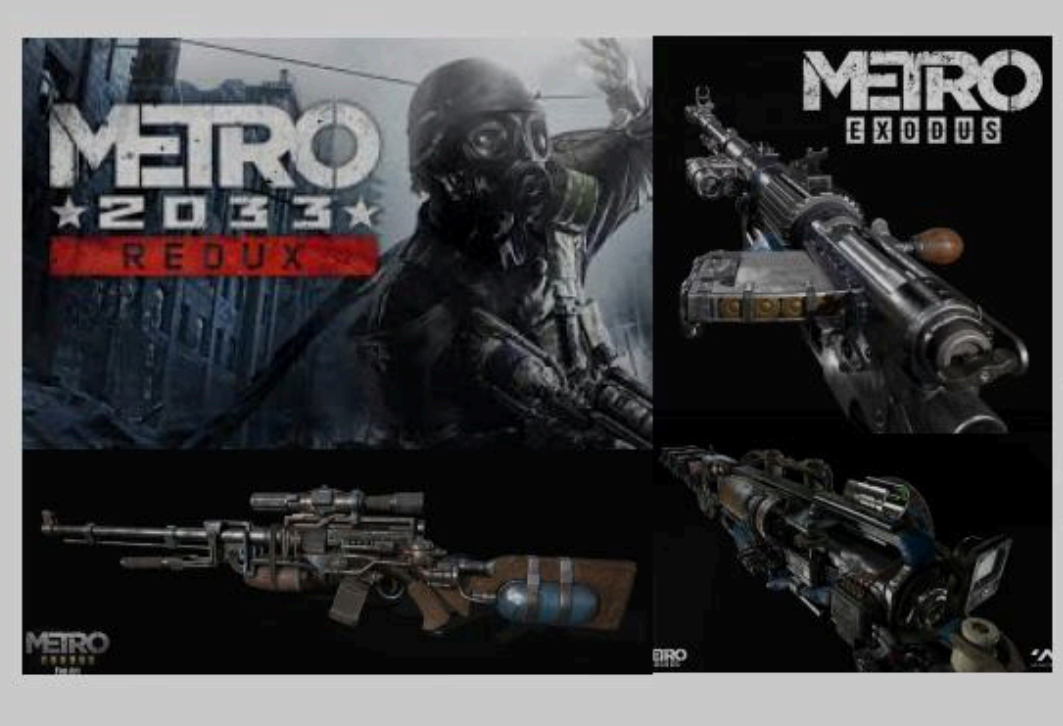
Inspiration:

Fallout4:



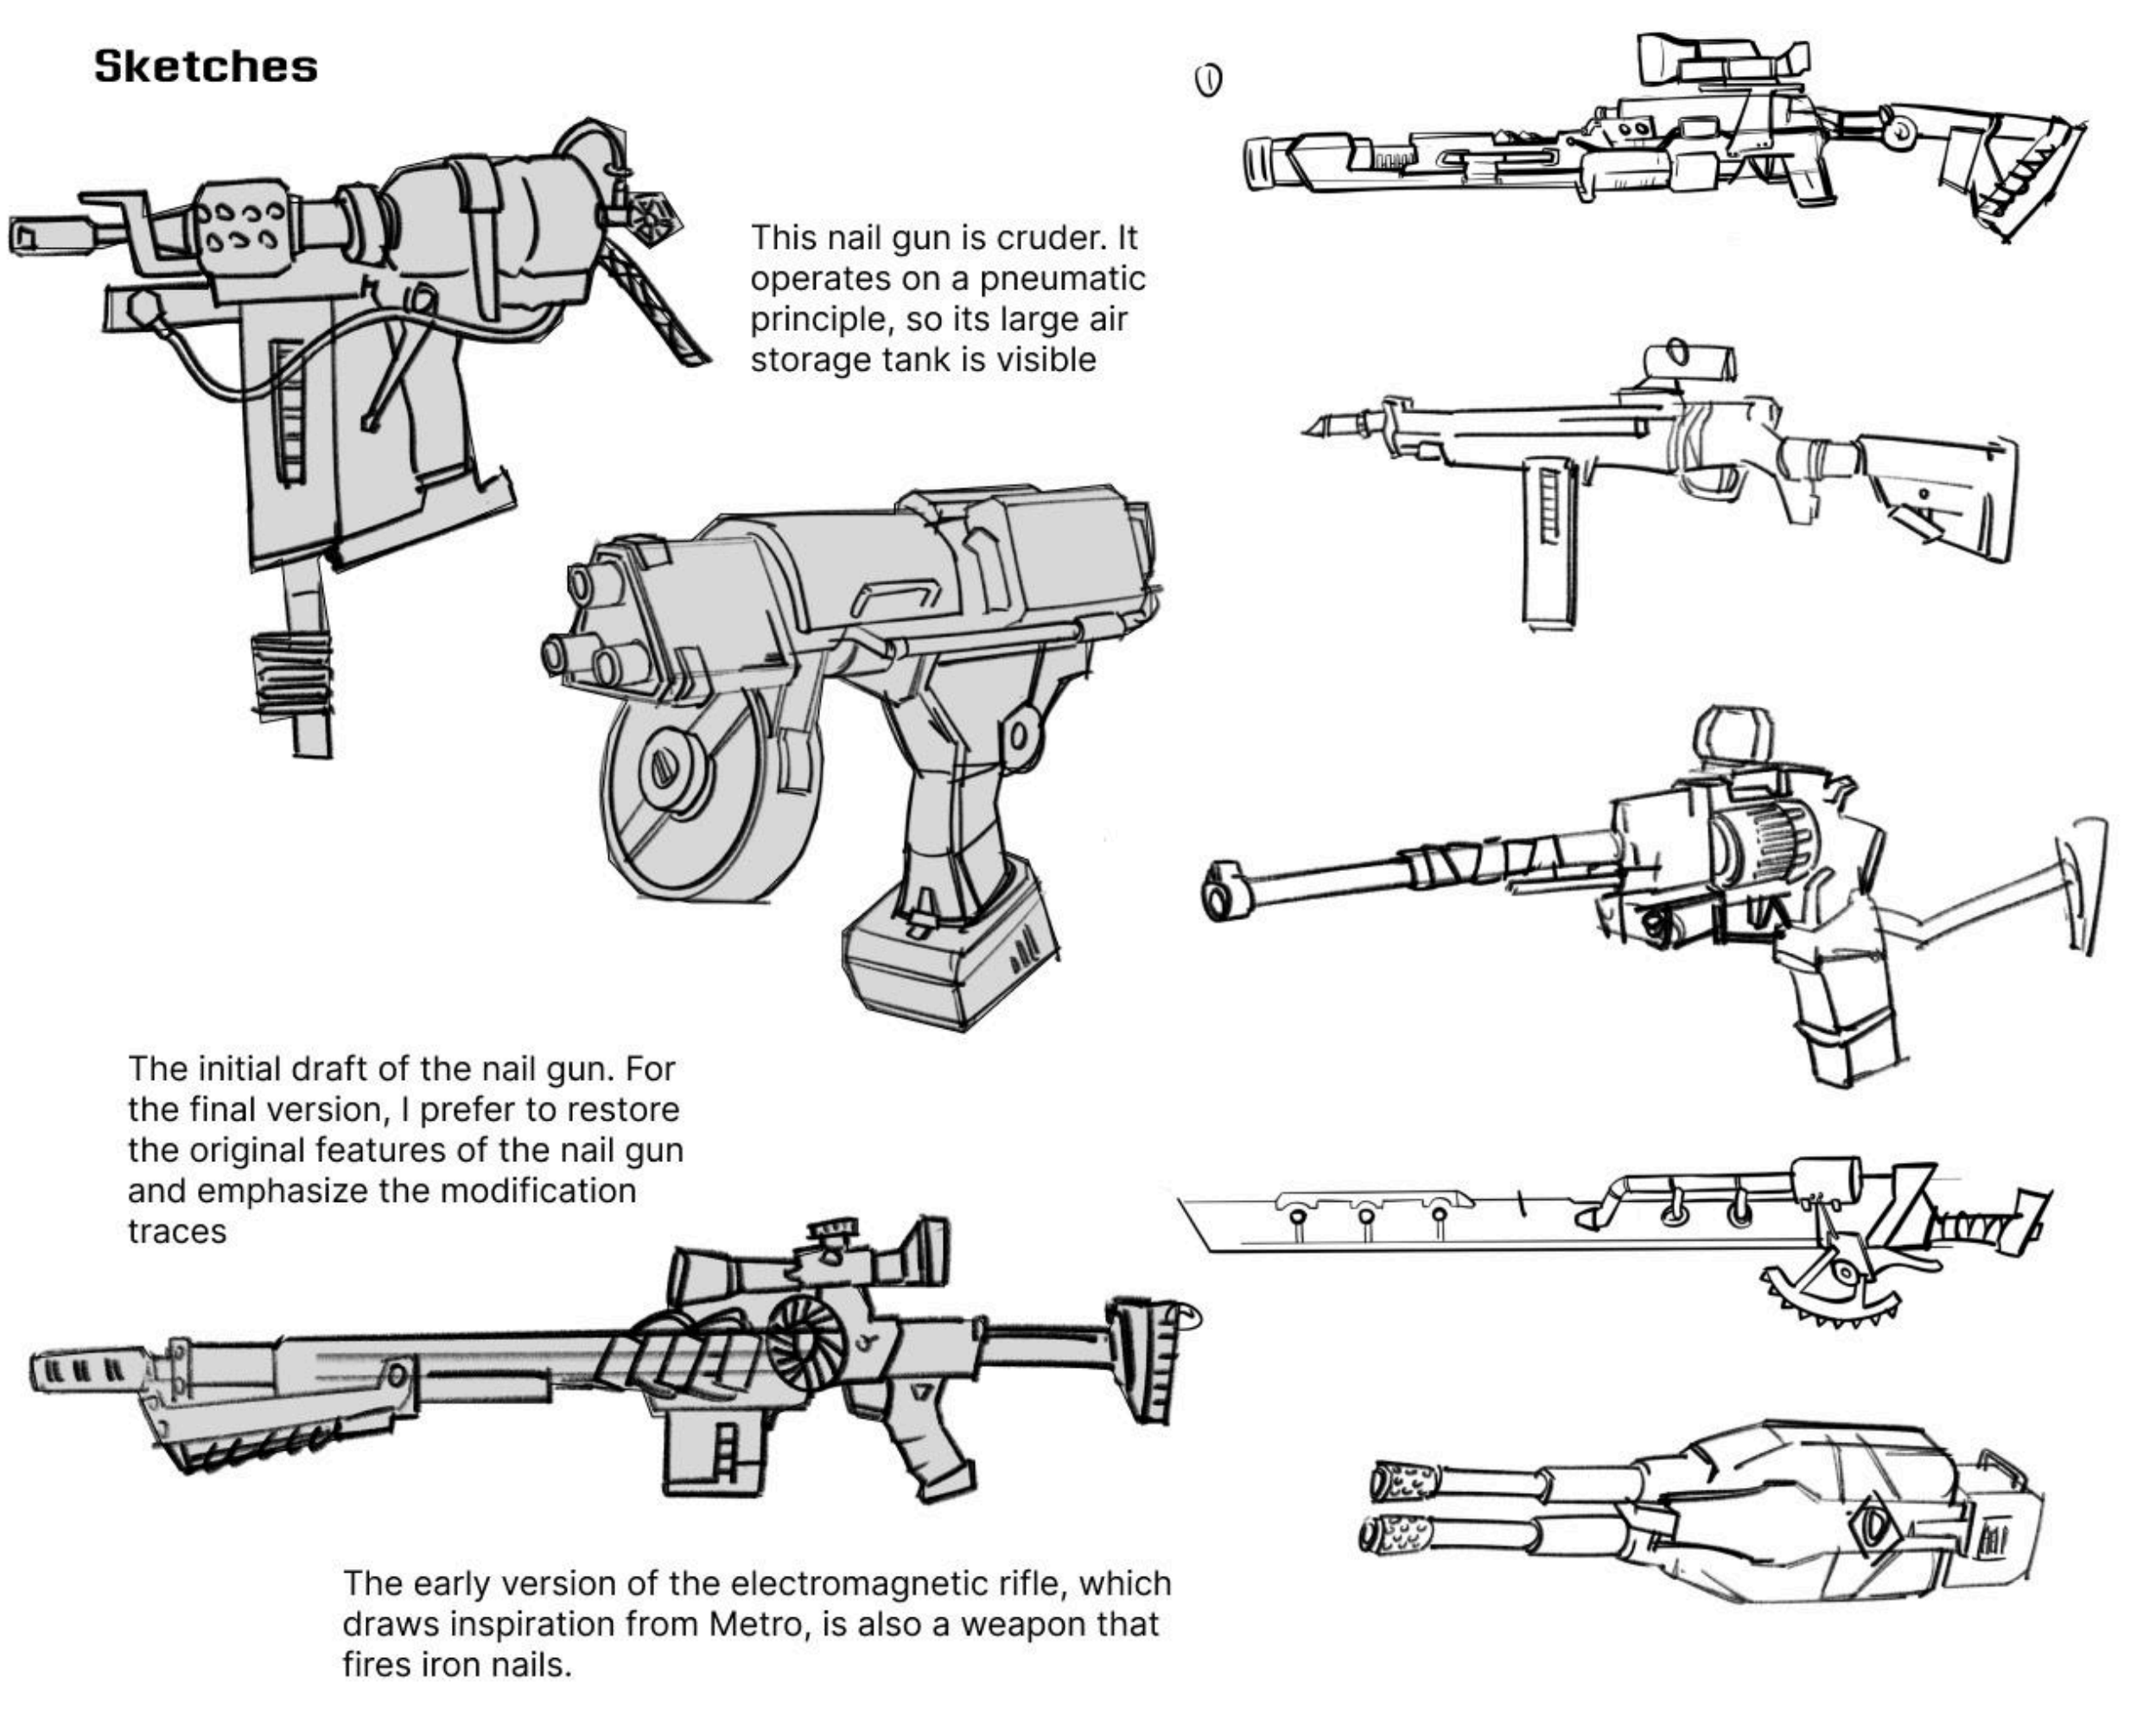
The Fallout video game series is set in the aftermath of a nuclear war. With industrial infrastructure destroyed, humanity can only survive in bunkers—though in reality, some people have also established small towns on the surface. This game also features a unique industrial aesthetic and ranks among my favorite post-apocalyptic games.

Metro2023 :



The 'Metro' video game series tells the story of survivors in Moscow who build bases in underground metro stations, defend against mutated creatures, and compete against other survivor factions. Against this backdrop, survivors can only rely on crude homemade weapons and modify existing tools—giving rise to its distinctive aesthetic style.

Sketches



This nail gun is cruder. It operates on a pneumatic principle, so its large air storage tank is visible

The initial draft of the nail gun. For the final version, I prefer to restore the original features of the nail gun and emphasize the modification traces

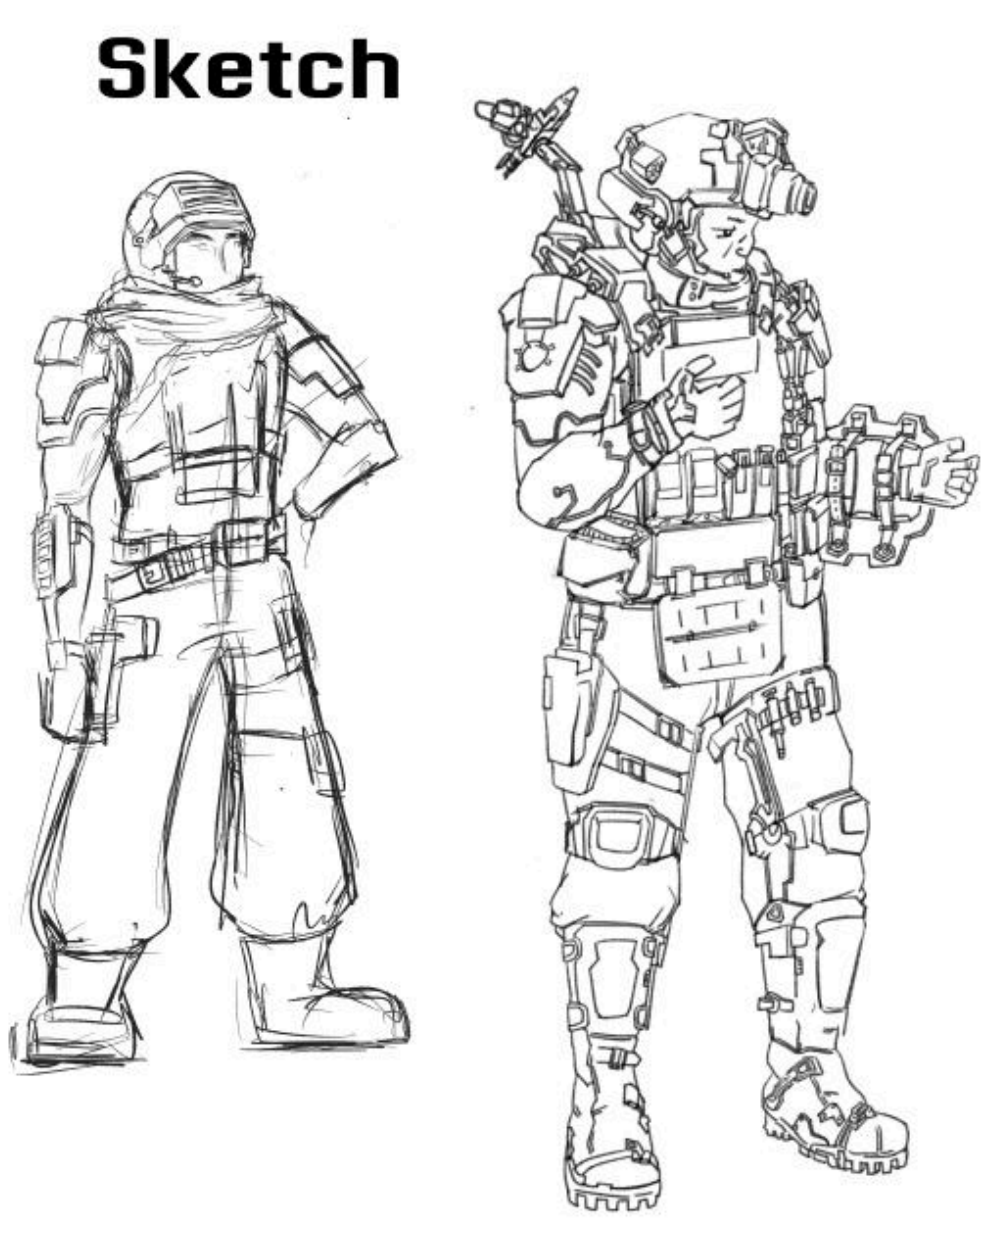
The early version of the electromagnetic rifle, which draws inspiration from Metro, is also a weapon that fires iron nails.

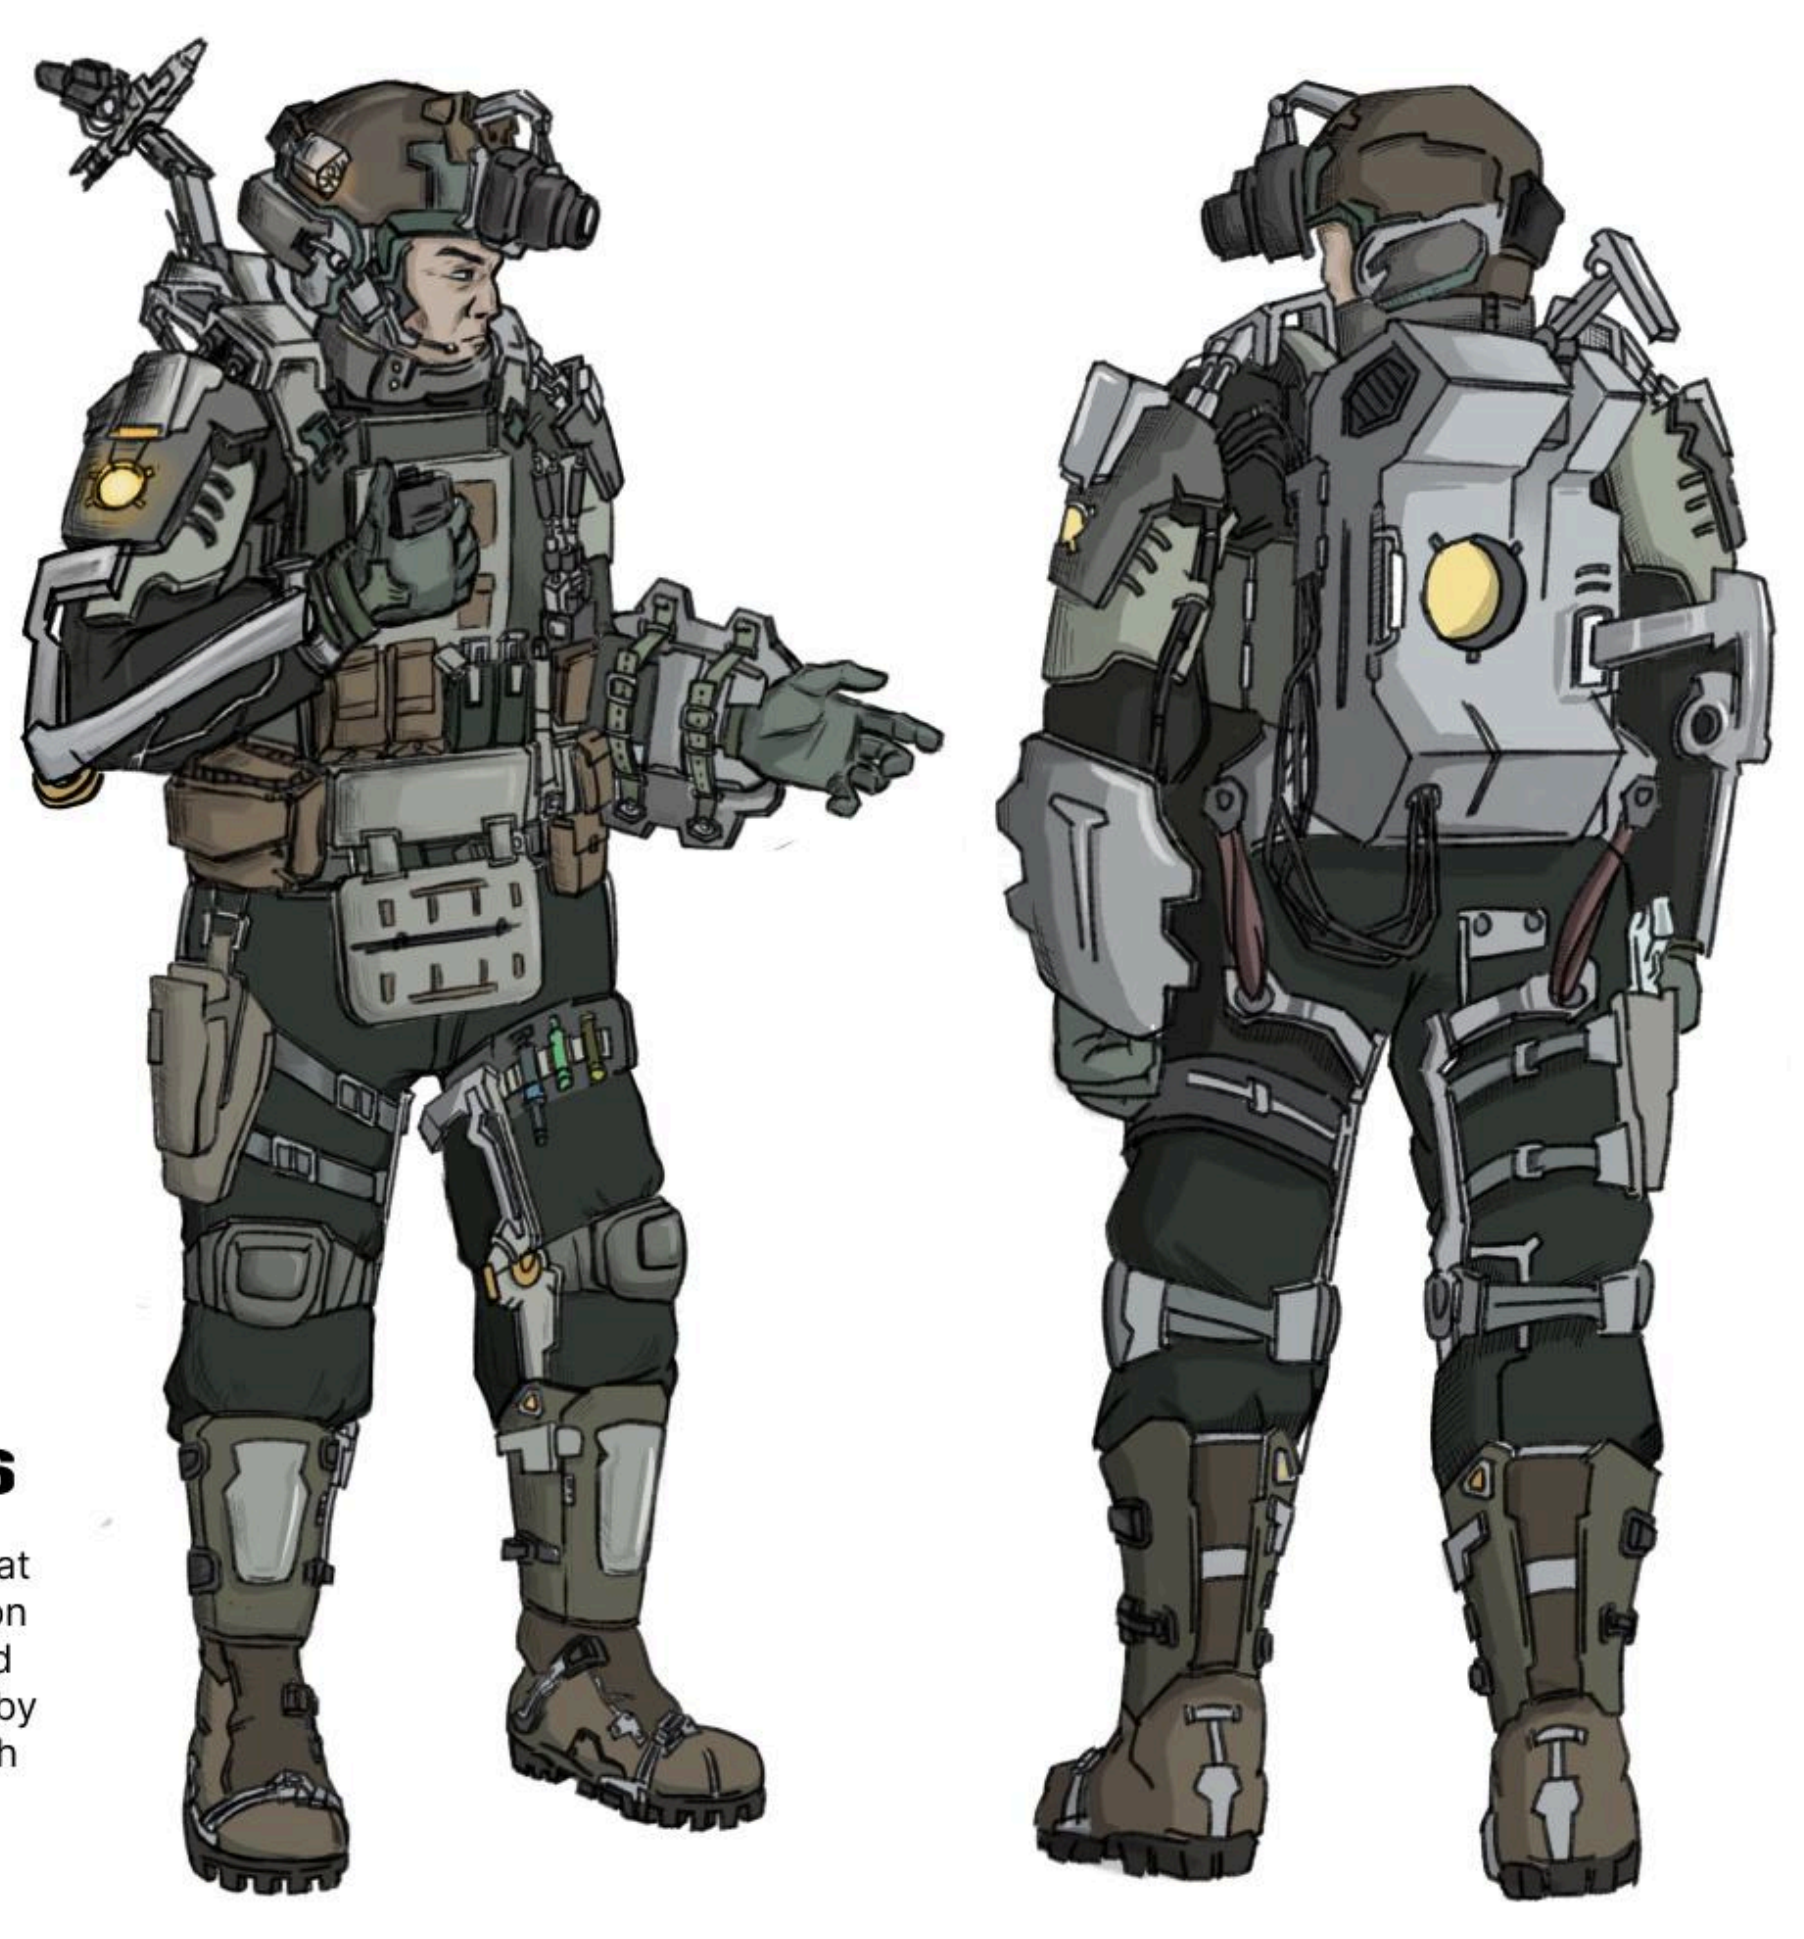
CHARACTER DESIGN

Silhouette Sketch

References

Sketch





Hawthorne Elias

Former elite of the rebel guerrillas, he excels at combat in harsh terrains. He regularly relies on exoskeletons to aid in battle, with a calm and cautious approach to operations. A lone wolf by nature, he consistently pulls off missions with excellence—always returning unscathed.

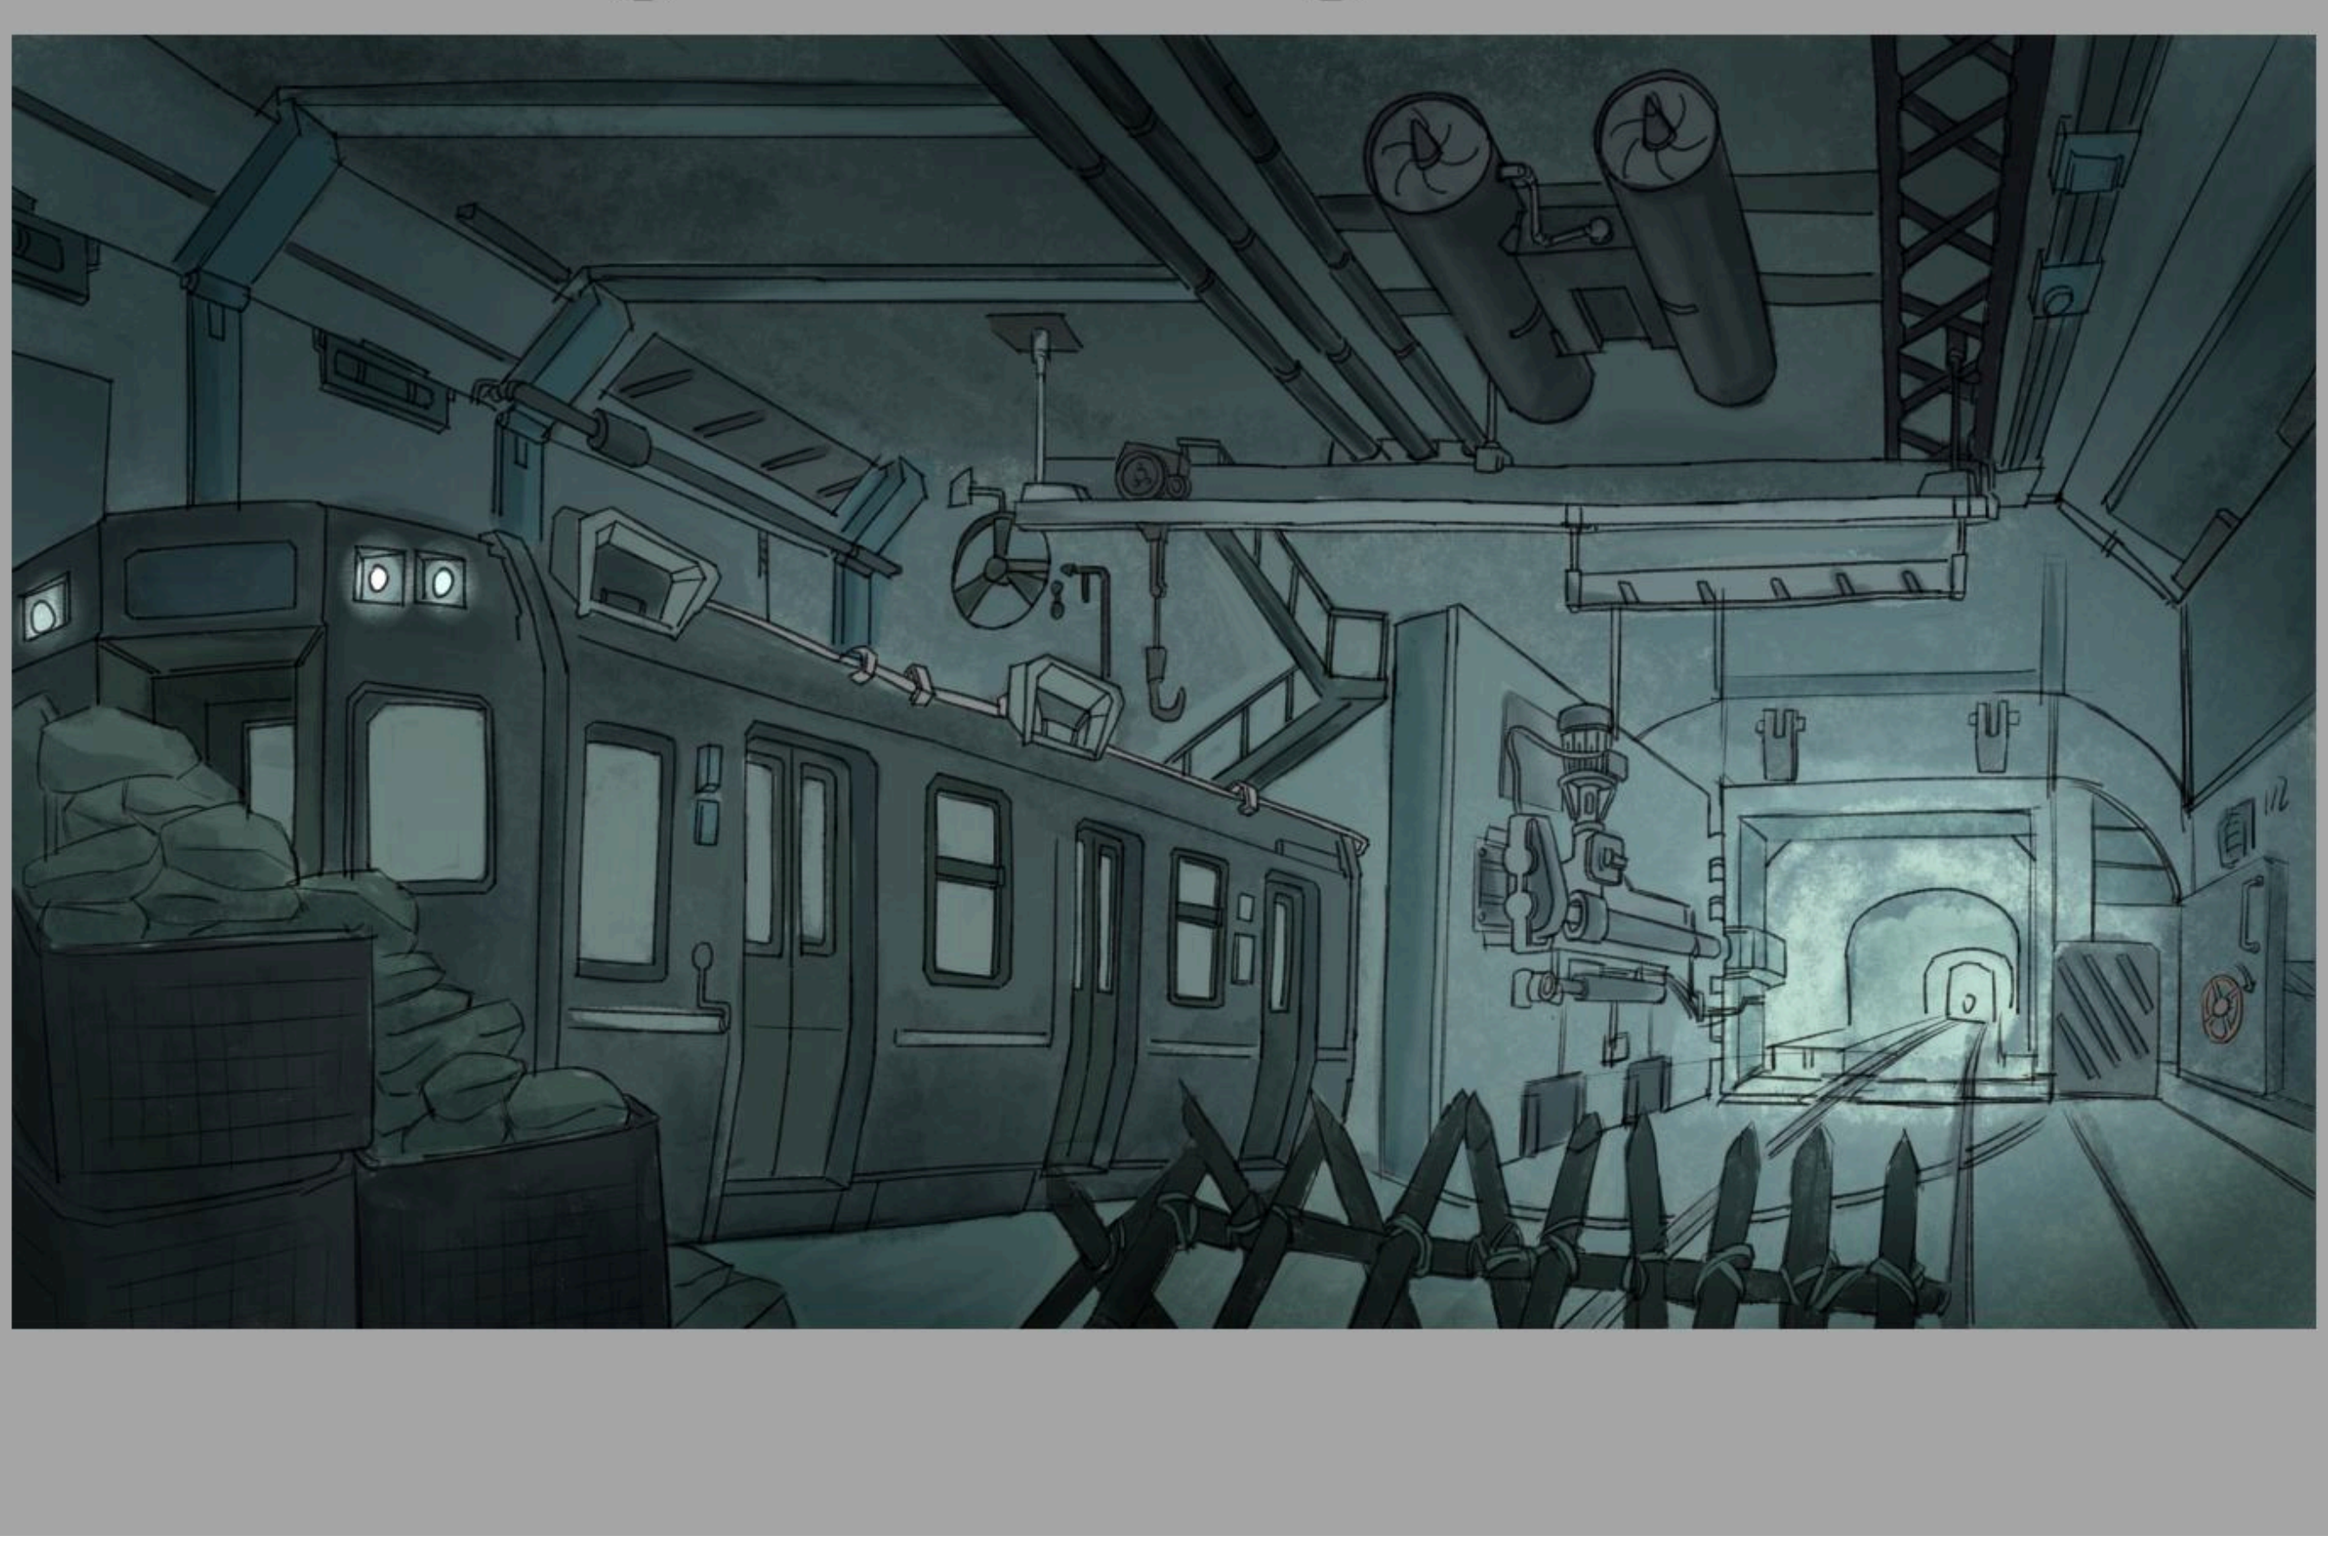
Final Background Design



NAIL GUN DESIGN

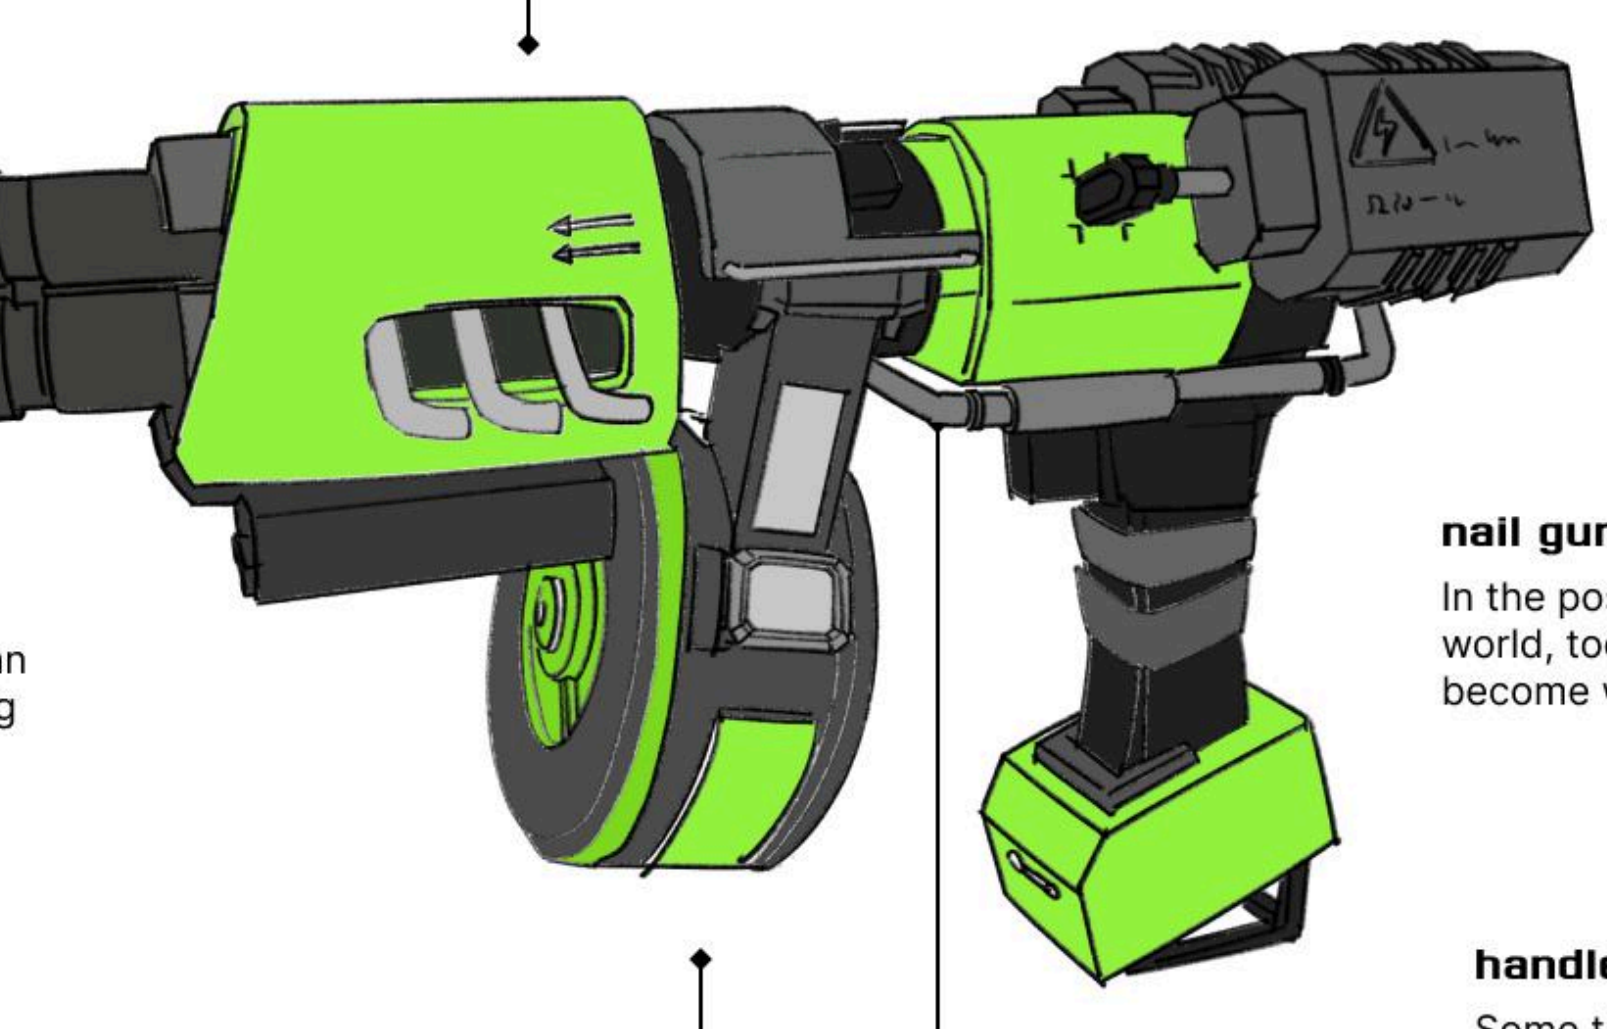
This is a weapon modified from an industrial nail gun. Driven by electromagnetism, it fires a large number of high-velocity iron nails and features extremely high killing efficiency against unarmored units. To ensure sustained firepower, a drum magazine is used for ammunition feeding, and a replaceable high-density energy battery is installed at the grip.

Handguard

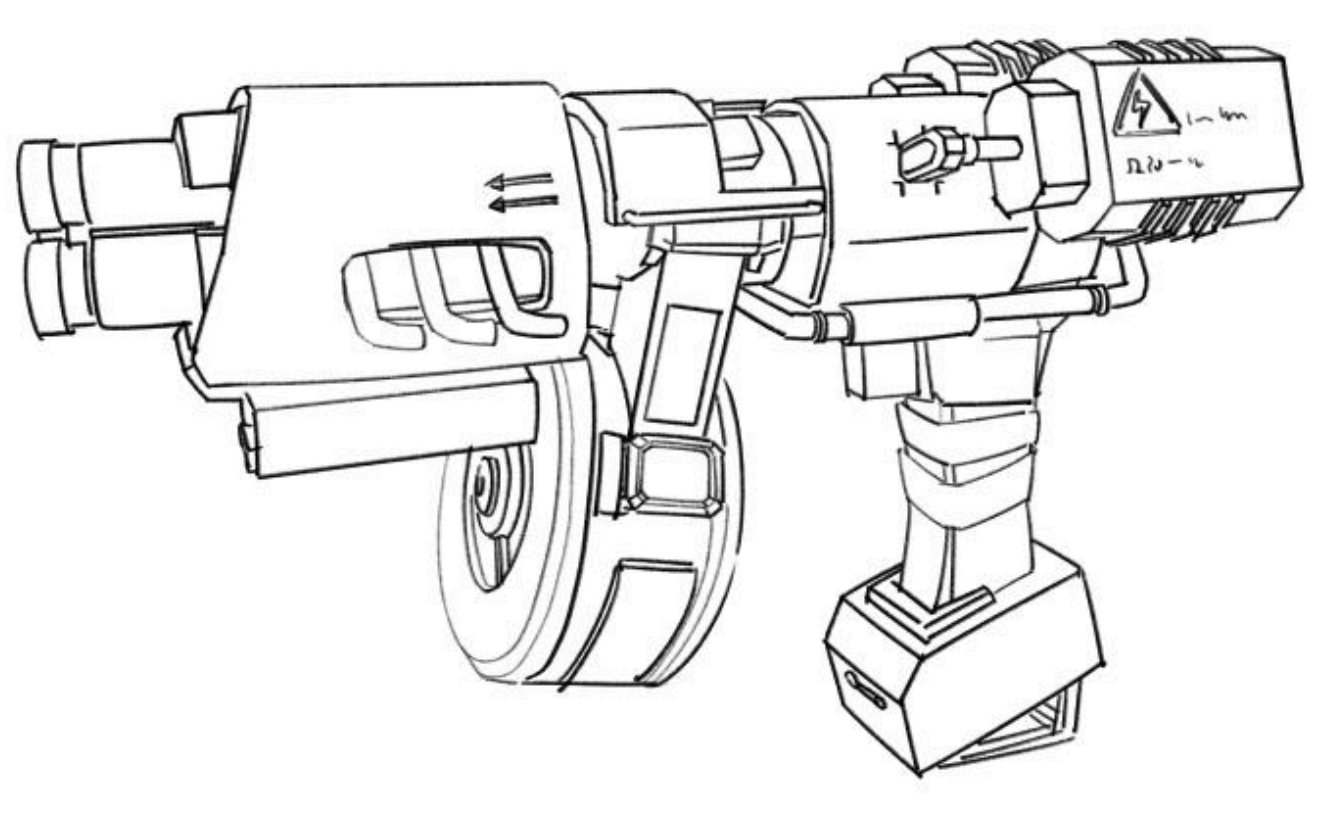
It balances heat dissipation while preventing accidental injury to the operator

motor

Two external electric motors with excellent heat dissipation capabilities



Silhouette Sketch



Drum magazine

A small digital display that can intuitively show the remaining ammunition capacity

nail gun

In the post-apocalyptic world, tools can also become weapons

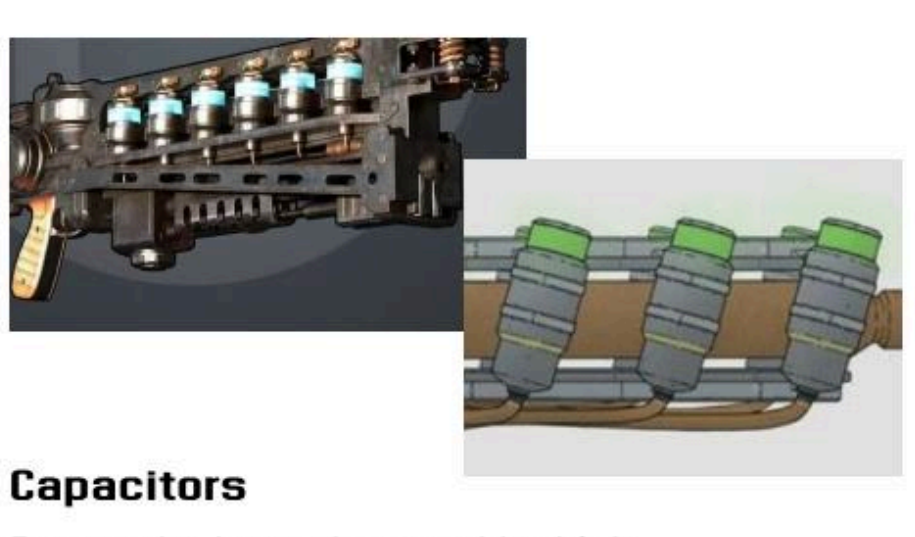
handle

Some tape is wrapped around it for anti-slip purposes

Core Reference

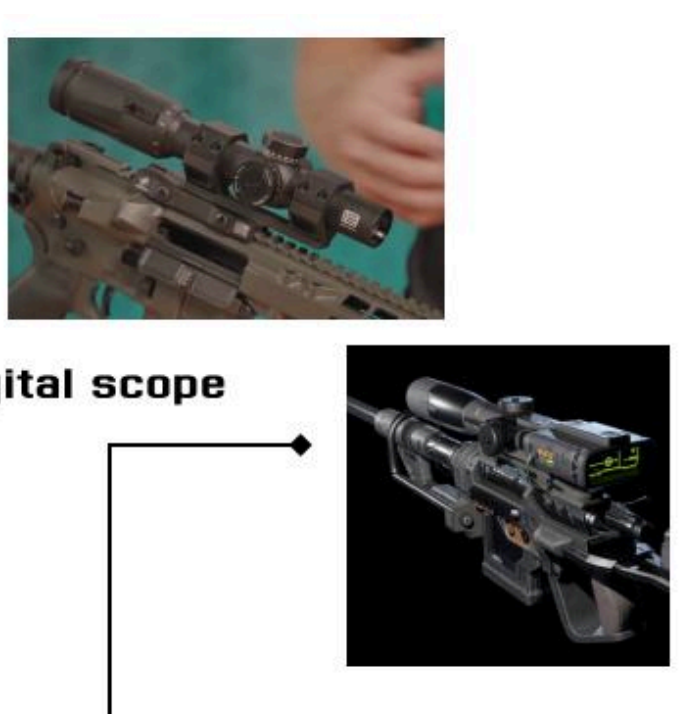
SNIPER RIFLE DESIGN

This is an electromagnetic rifle that uses a large number of coils and capacitors to provide kinetic energy for its spike projectiles. The projectiles are similar to the armor-piercing fin-stabilized discarding sabot (APFSDS) rounds used in real-world tanks, boasting extremely strong armor-piercing capabilities, and it stands as a crystallization of technology in the post-apocalyptic world.

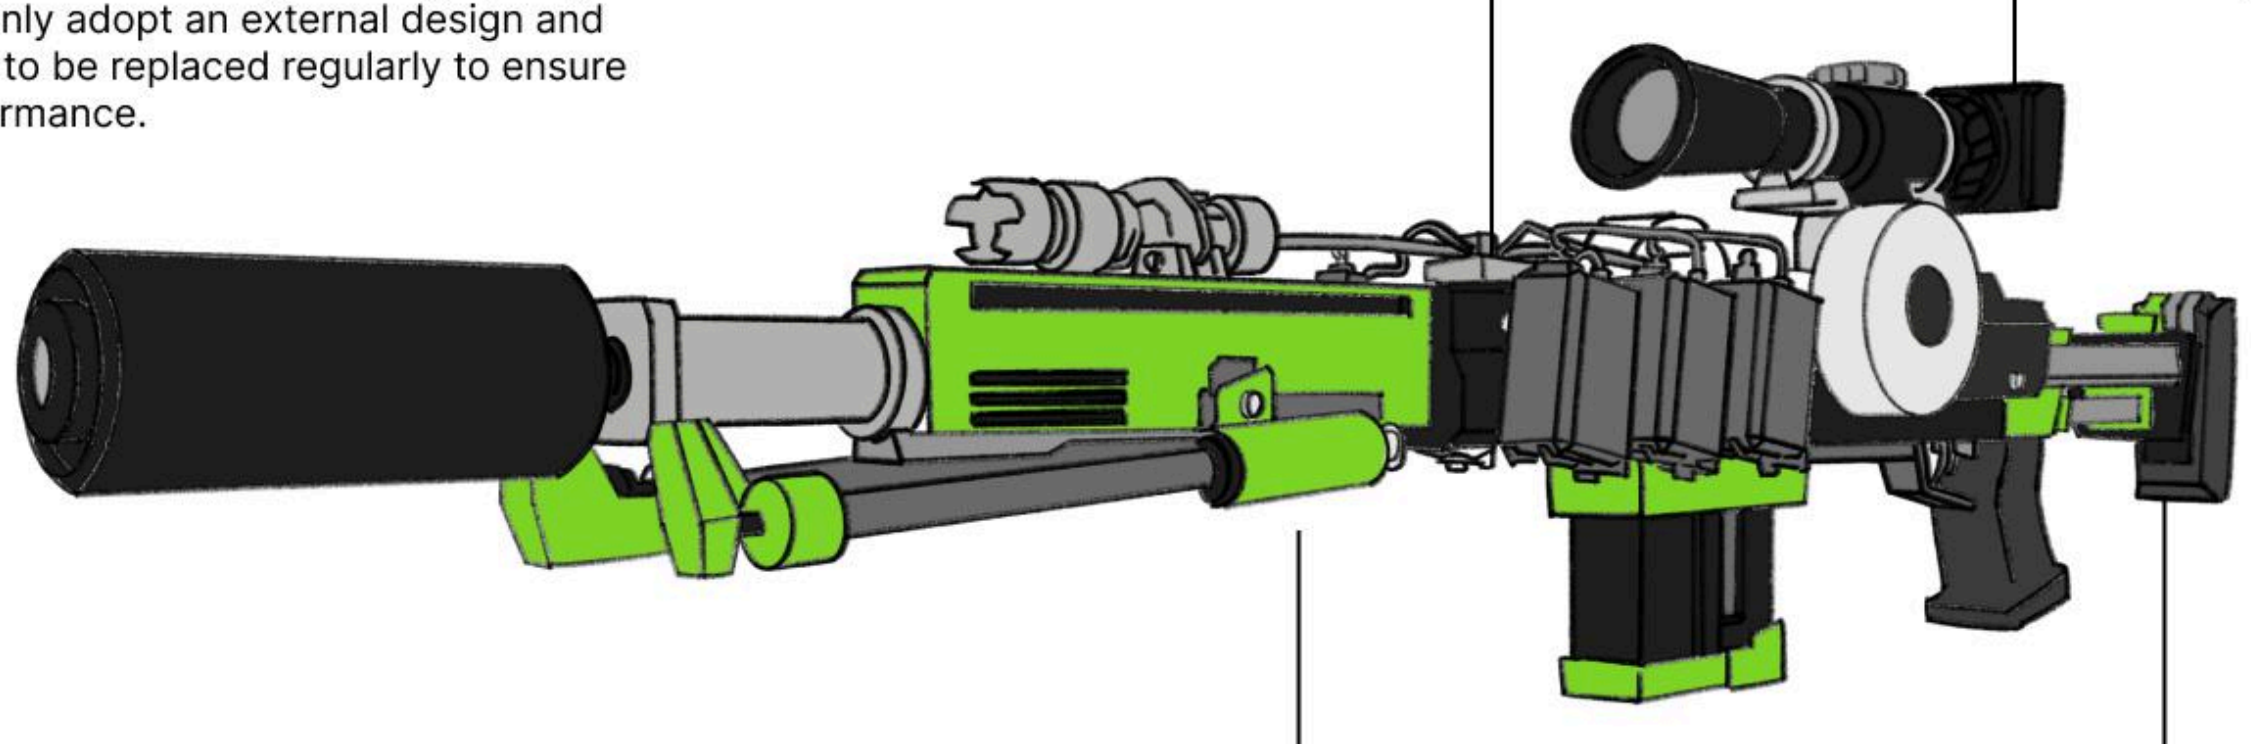


Capacitors

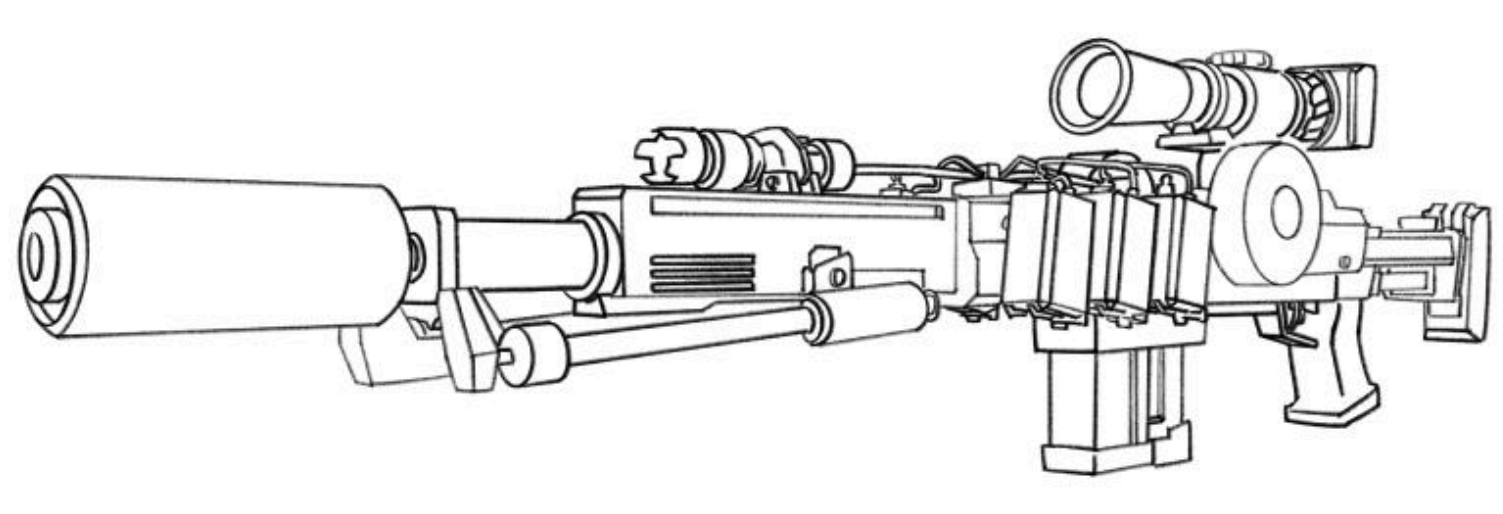
Due to the hazards posed by high temperatures and high voltages, they can only adopt an external design and need to be replaced regularly to ensure performance.



Digital scope



Silhouette Sketch



Bipod

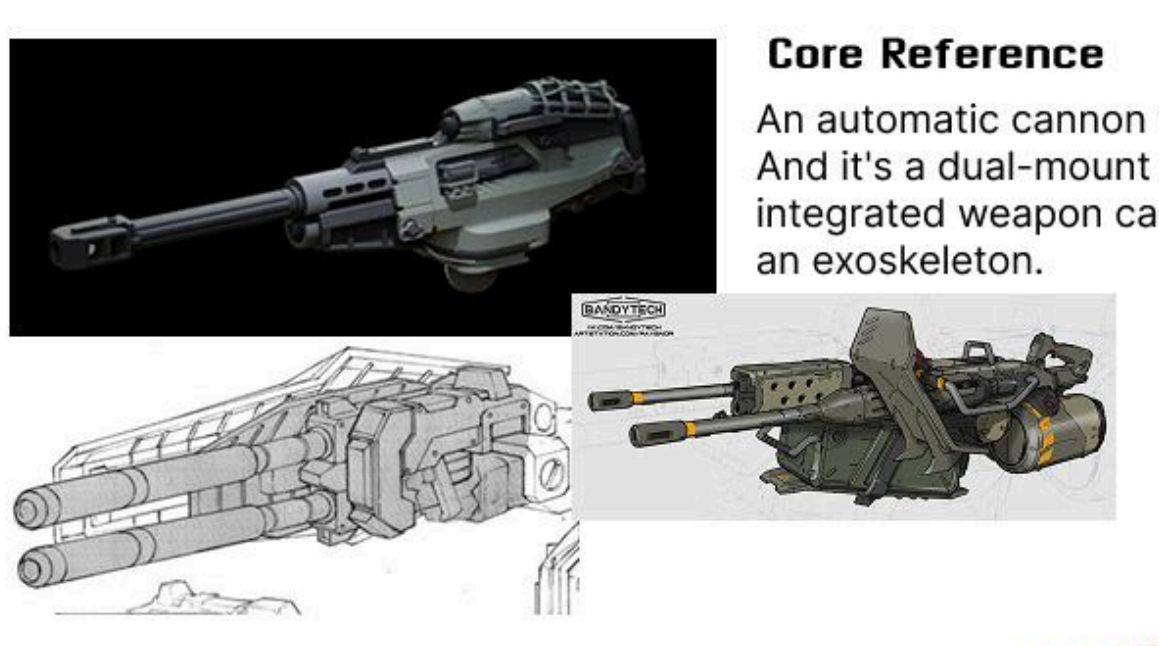
Its spring system ensures that it can adapt to all types of terrain

Stock

Its telescoping design draws inspiration from the real-world MK14

CANNON DESIGN

This is a dual-mount fully automatic cannon, equipped with a highly integrated ammunition feeding system and a replaceable, upgradeable fire control module. Like other weapons in this series, it is also an electromagnetic weapon, but its projectiles have been upgraded from iron spikes to tungsten alloy armor-piercing rounds. As the top-tier specification among individual weapons, only an exoskeleton can support its weight.

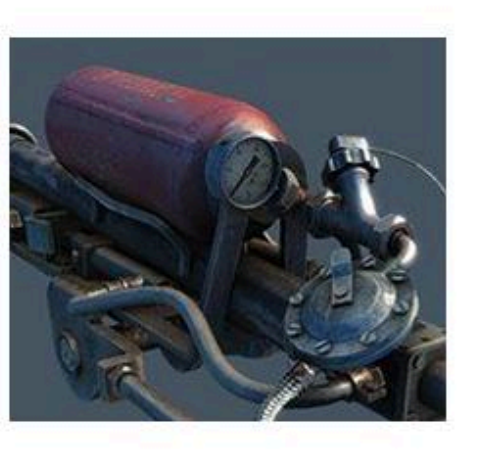


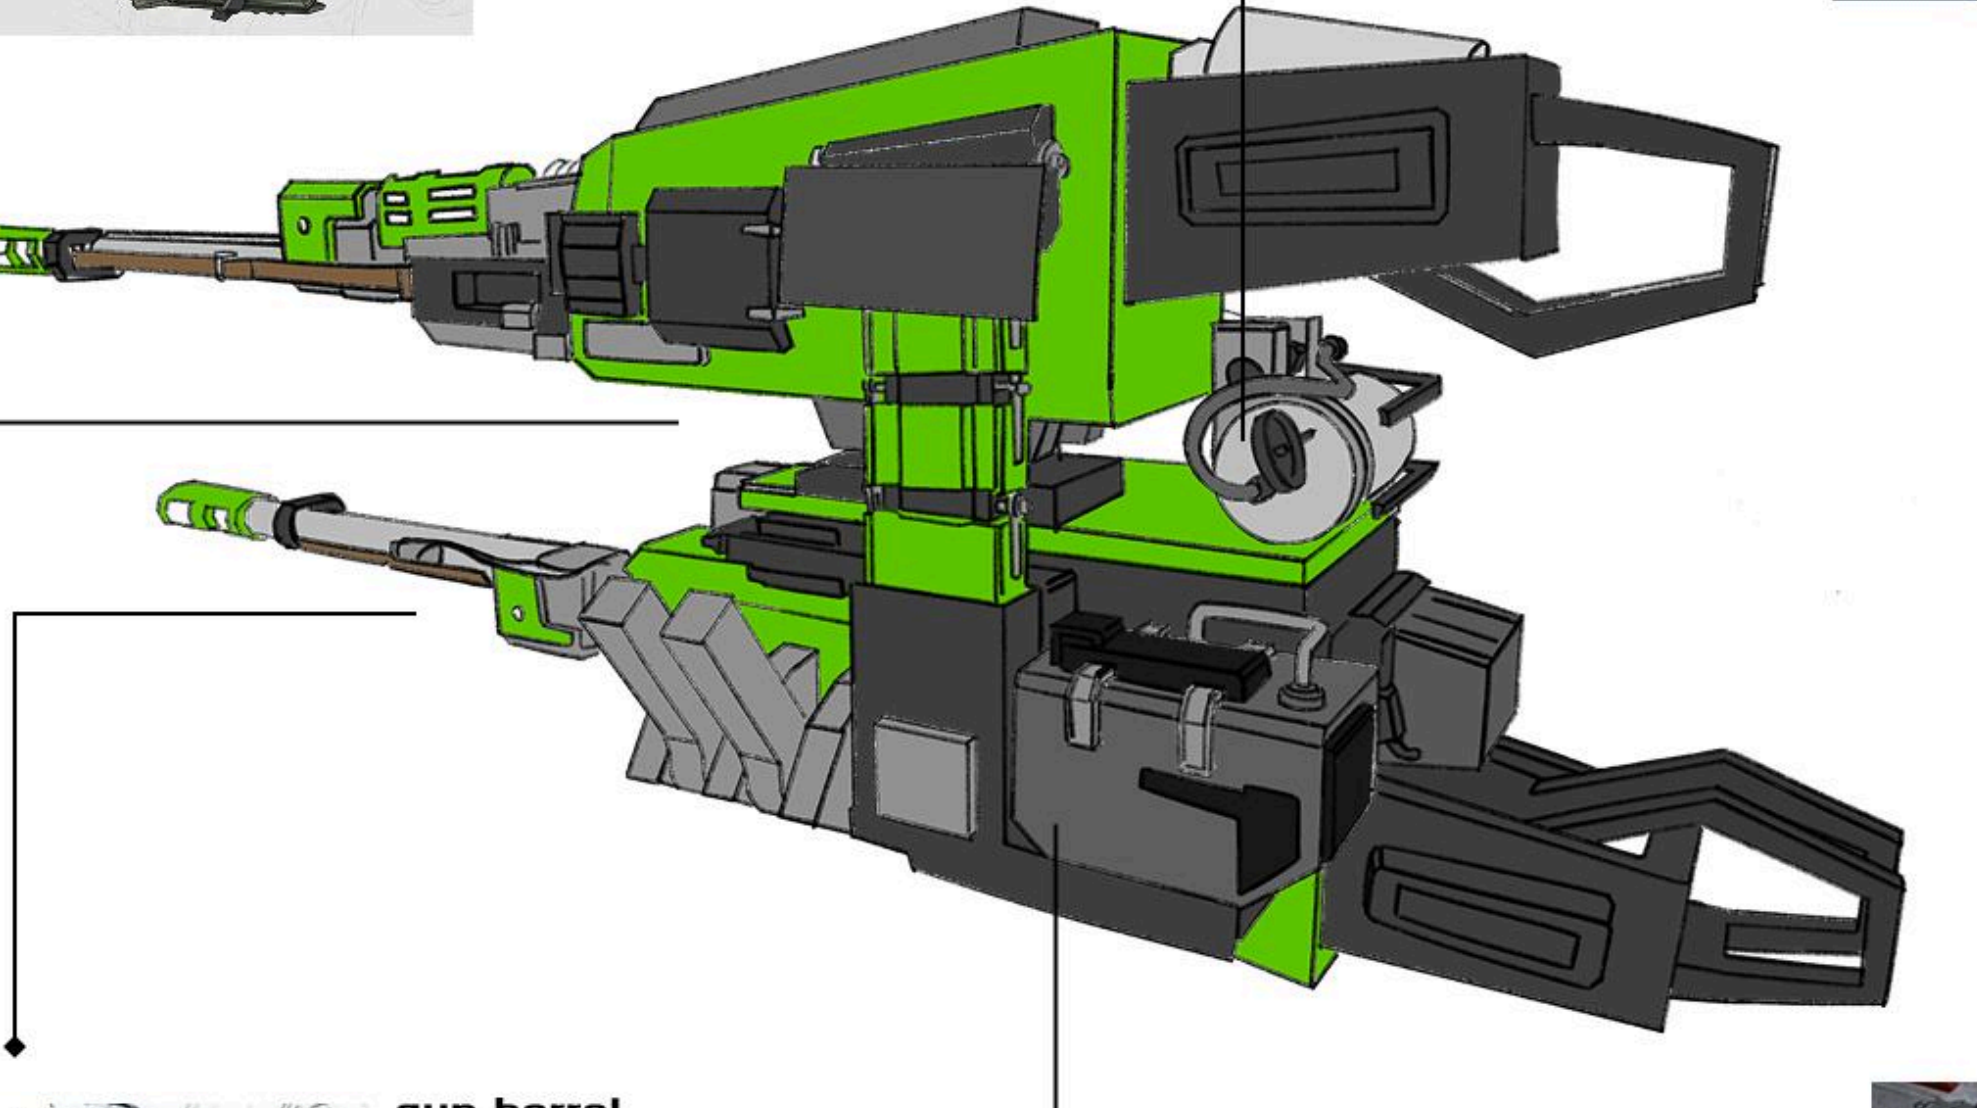
Core Reference

An automatic cannon with a 20mm caliber? And it's a dual-mount one? Such an integrated weapon can only be carried by an exoskeleton.

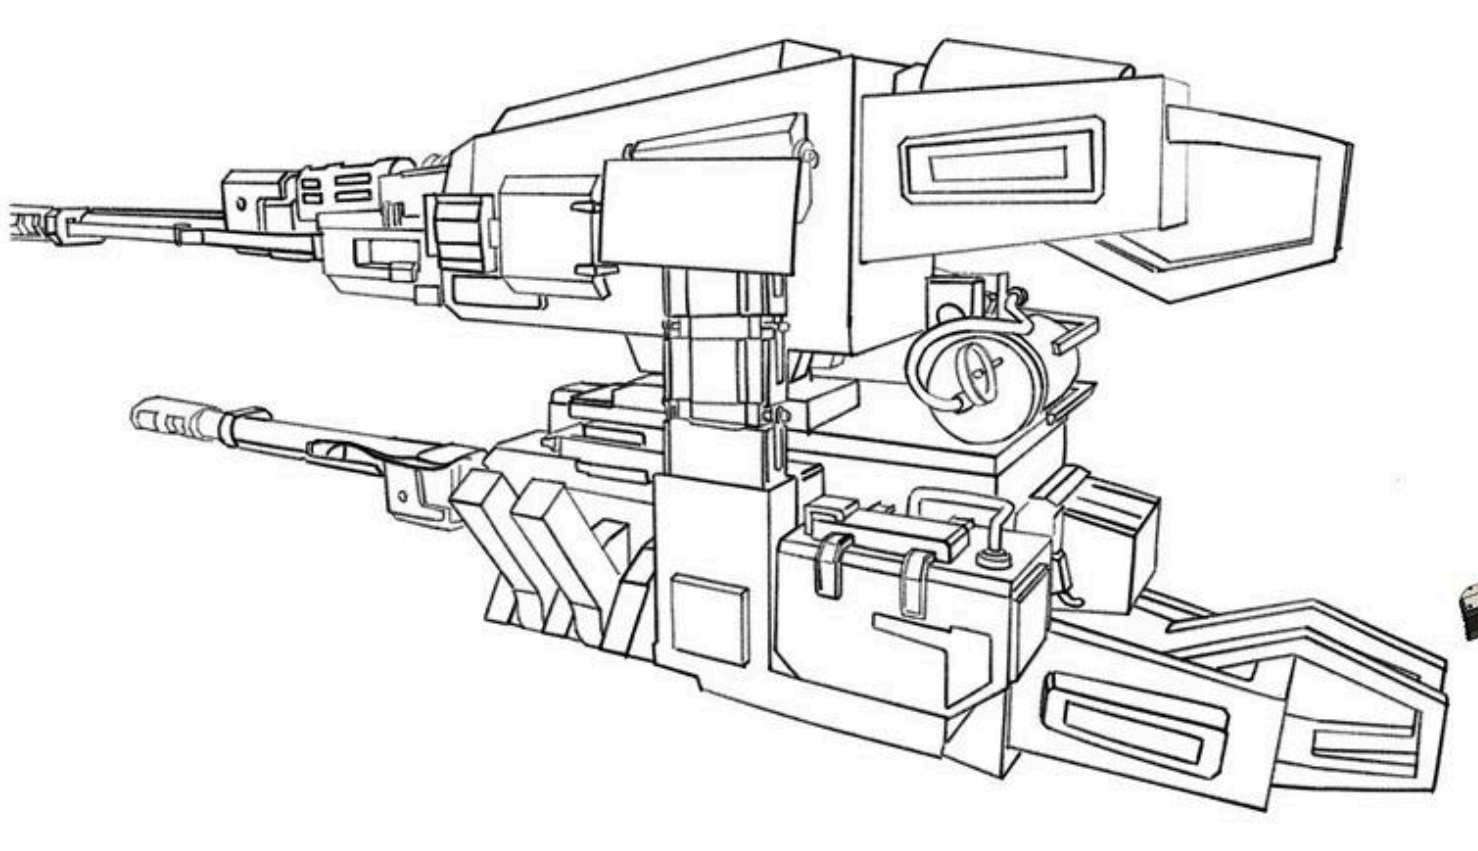
Hydraulic system

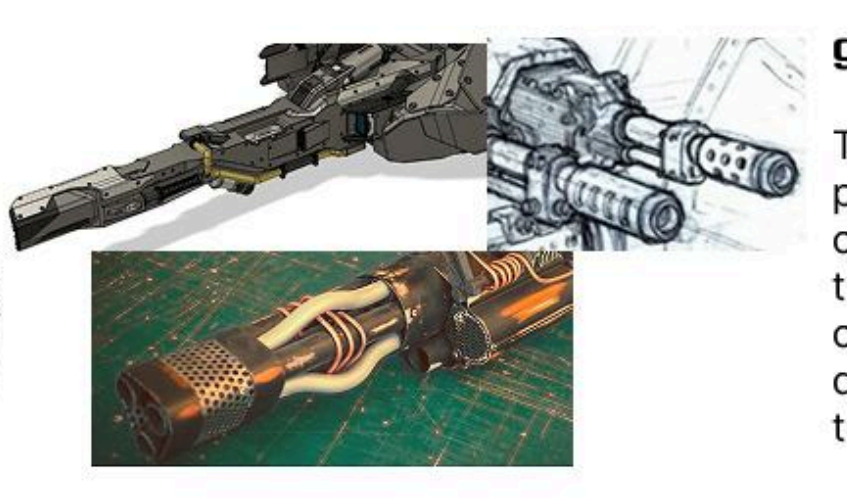
It is responsible for adjusting the gun's elevation and depression, so only a simple structure is required.





Silhouette Sketch





gun barrel

The design of the barrel primarily focuses on cooling efficiency, and the cables at the muzzle can transmit real-time data to the processing terminal.

ANMO BOX

A highly integrated ammunition system that allows for quick replacement of the ammo box

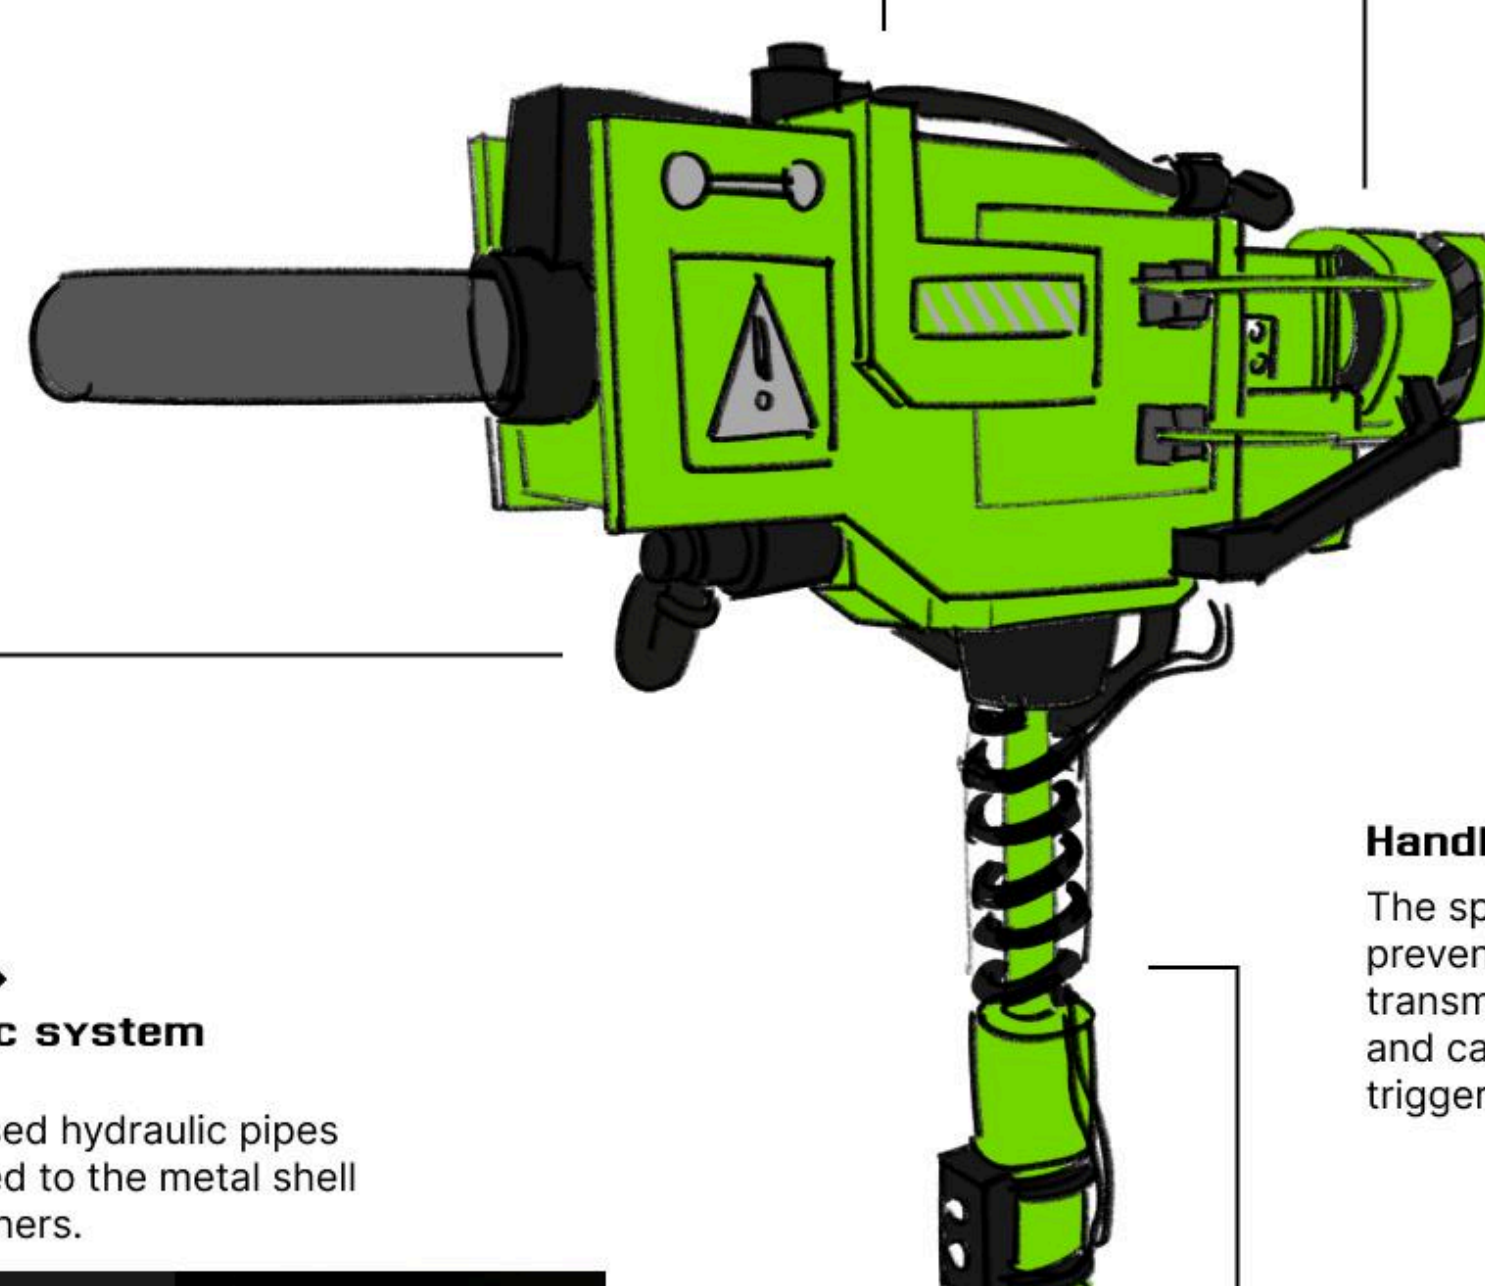
BREAKER HAMMER

Core Reference

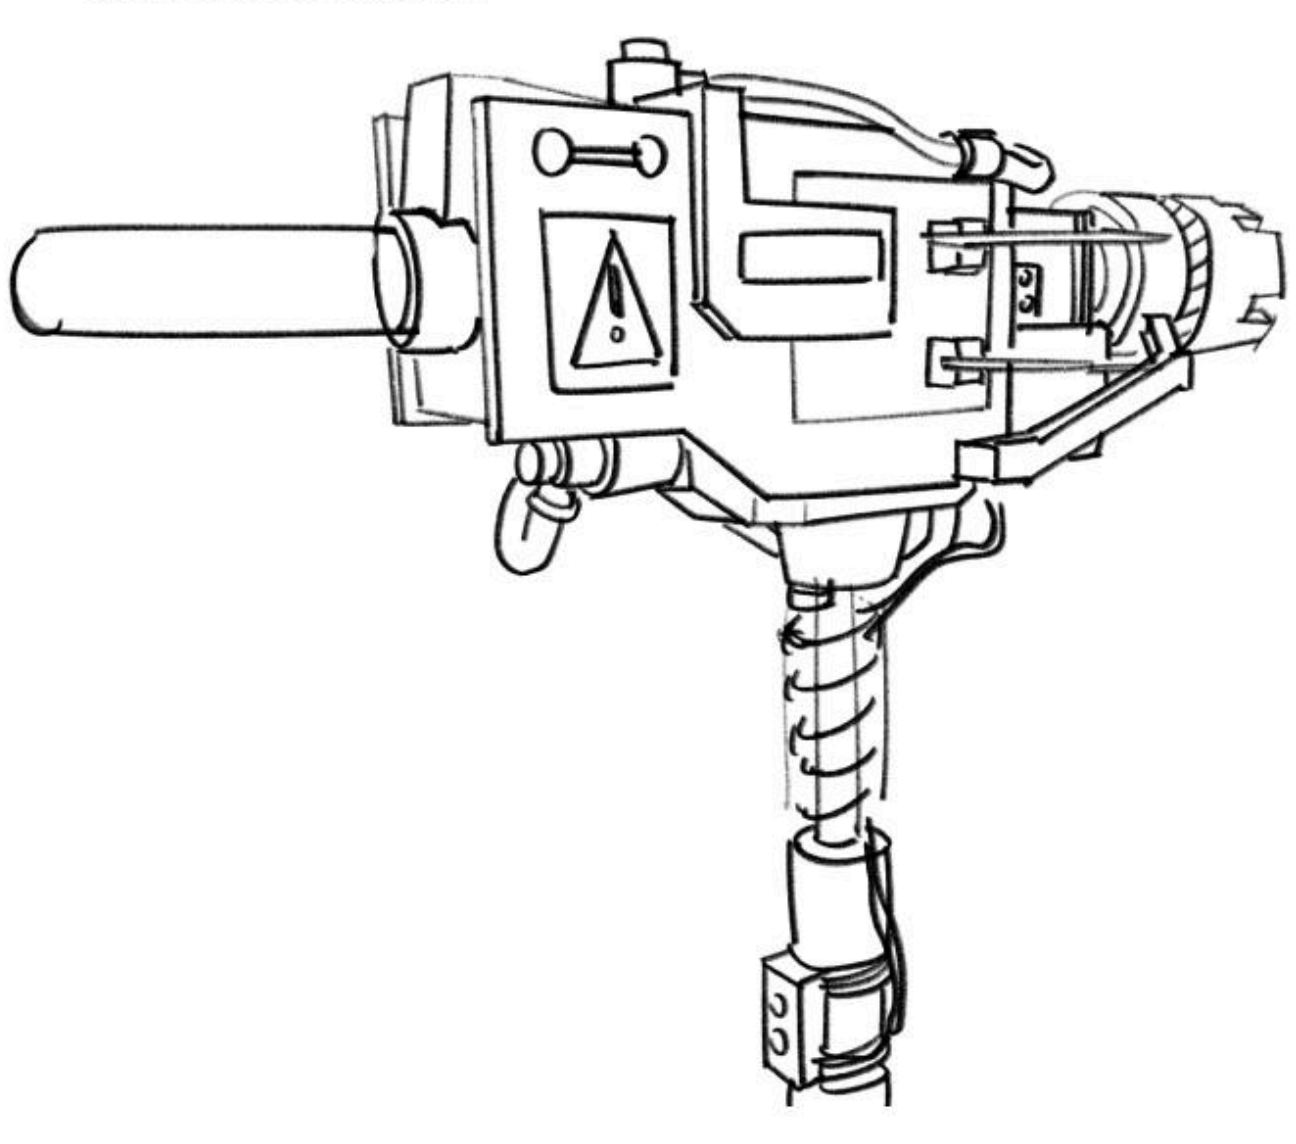
A hydraulic demolition hammer commonly found on excavators

How to make a powerful and reliable melee weapon under post-apocalyptic conditions? A hydraulic system and a rocket engine are good options. The main body of this weapon is a demolition hammer kit from an excavator, with its original hydraulic system modified. It generates high-frequency vibrations through a hydraulic directional control valve, making it an extremely powerful blunt weapon. The design of the rocket engine is quite brutal; it is activated via a button on the grip, but its fuel supply is limited.

Rocket engine

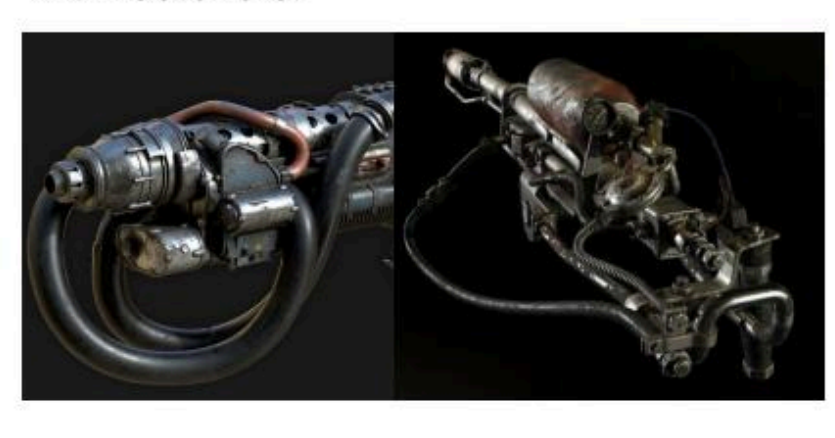


Silhouette Sketch



Hydraulic system

The exposed hydraulic pipes are secured to the metal shell with fasteners.



Handle/Controller

The spring shock absorber prevents vibration from transmitting to the hand and causing accidental triggering.
