Inspiration

Background Inspiration

Echosine draws its inspiration from a deep reflection on human desire and fear. The project centers on the theme of humanity's obsession with controlling the unknown, exploring the fragile boundary between scientific ambition, ethical transgression, and environmental collapse. Set in a seemingly ordinary hospital, the player gradually uncovers traces of a series of human experiments conducted in the name of "healing." These experiments, however, led to the breakdown of consciousness and the distortion of life itself. The hospital's corridors and its underground laboratory become symbols of human arrogance—a monument to civilization that simultaneously imprisons the remains of reason.

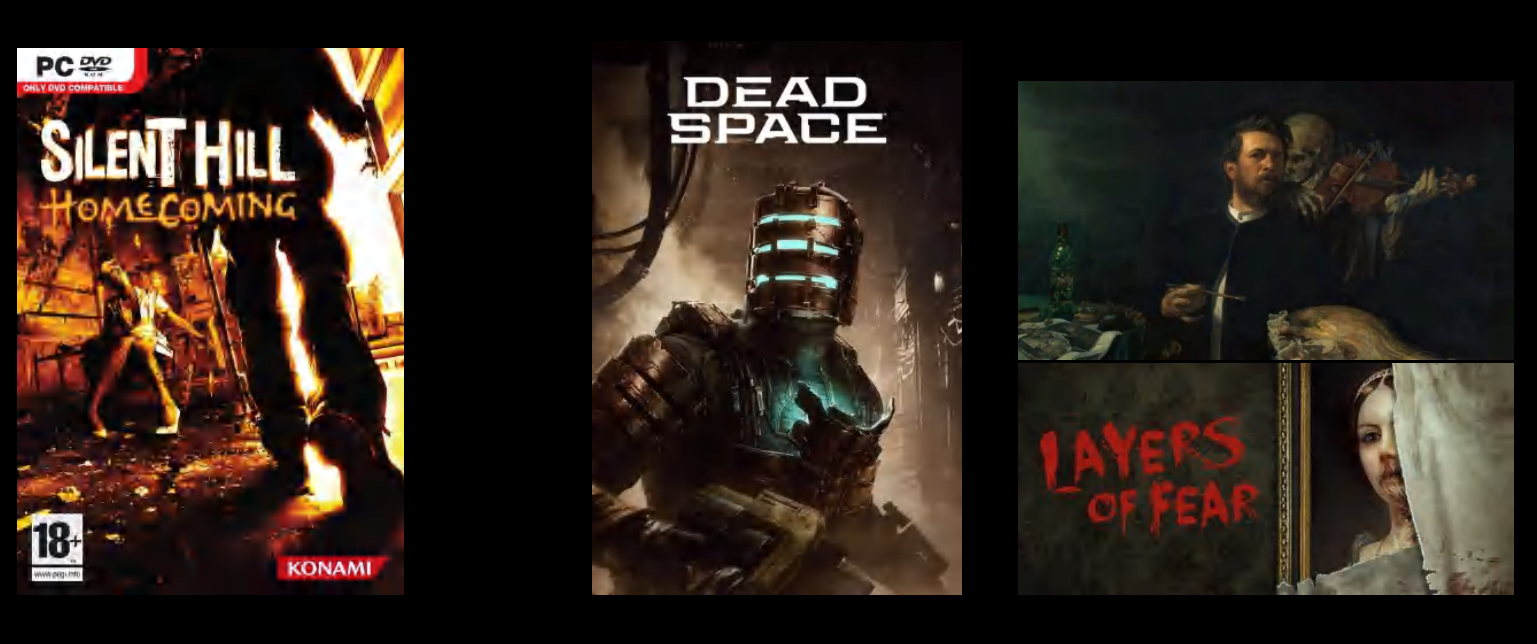
The game's psychological horror tone draws inspiration from Dead Space, Silent Hill, and Layers of Fear, combining the disorientation of these works with the metaphors of real-world anxieties—ethical violations, genetic manipulation, and environmental overexploitation. By transforming these fears into symbolic horror, Echosine aims to evoke a terror not born of external monsters, but from within: the fear of human reason collapsing under its own pursuit of knowledge.

Ultimately, Echosine is more than a journey of escape; it is a mirror reflecting the cycle of human desire, fear, and self-destruction. When humanity seeks to master life and the unknown, it steps ever closer to being consumed by what it has created.

Art Inspiration

The visual direction of Echosine draws from minimalist black-and-white aesthetics to reflect the game's psychological tension and moral ambiguity.
Influenced by Playdead's Limbo and Inside, the game removes color to strip away realism, focusing instead on shadow, form, and rhythm. This approach heightens emotional isolation and transforms familiar hospital spaces into abstract psychological landscapes.

In terms of narrative and mechanics, Echosine takes cues from the Dead Space series' themes of human experimentation, loss of control over unknown forces, and mental collapse. It also references Silent Hill and Layers of Fear in their spatial distortion, hallucination-driven storytelling, and portrayal of psychological disorientation.

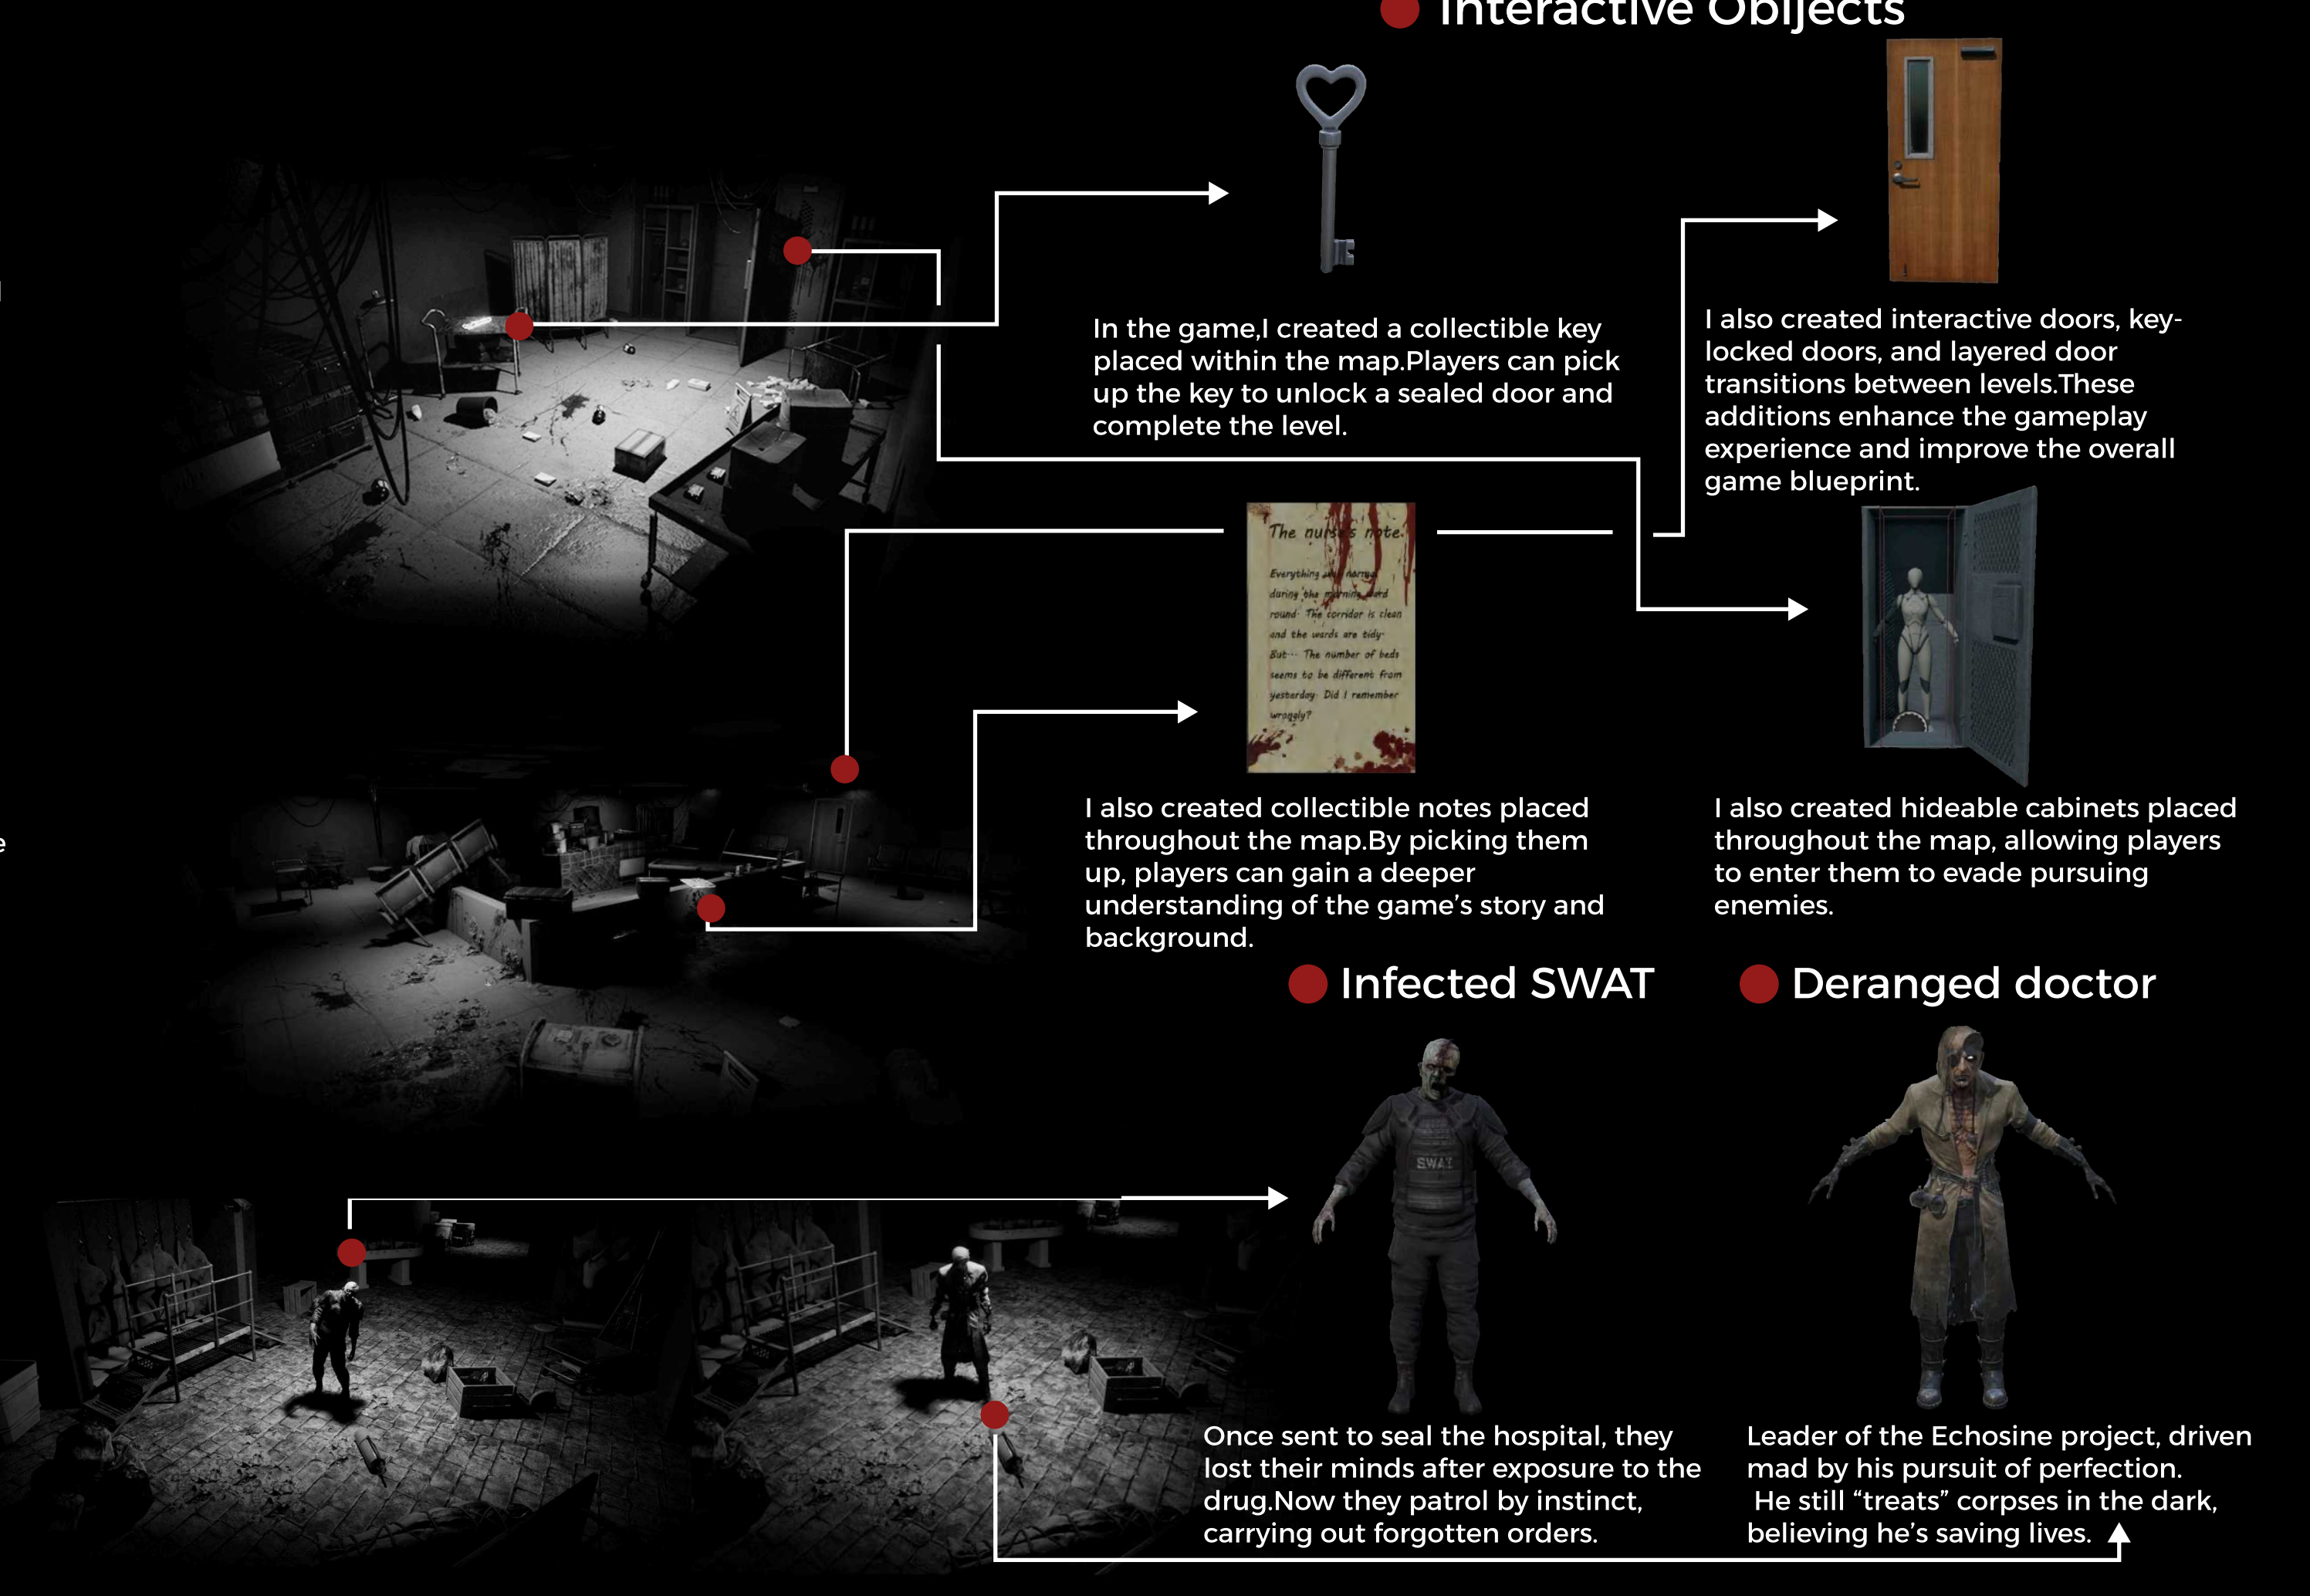


OVERVIEW

Background Story

St. Messiah Hospital was once hailed as a miracle of human medicine for developing a new drug known as "Echosine."
It could repair cells and slow aging — earning the name "The Second Life."
But during secret clinical trials, patients began showing signs of mental collapse and merged consciousness.
They claimed they could "hear other people's dreams" and "feel the world breathing."
Researchers dismissed it as mere side effects, yet kept increasing the dosage, trying to control the power.
Before long, the hospital was sealed off.
Officials claimed it was due to an infectious outbreak, but all internal records were erased.
Years later, investigator Ian is sent to the abandoned facility to reopen the archives and uncover the truth.
The deeper he ventures underground, the more unnatural the corridors become.
He witnesses victims of the drug's torment — some bodies still twitching,
while doctors murmur beside the dead, convinced they are "so close to success."
Their eyes are empty, yet twisted with fanatic smiles.
In the end, Ian discovers the horrifying truth:
the so-called "treatment" was nothing more than turning humans into vessels for the drug.
The doctors thought they were mastering life —
but in the silent whispers, life rewrote them instead.

Maps



Interactive Obijects

In the game,I created a collectible key placed within the map.Players can pick up the key to unlock a sealed door and complete the level.

I also created interactive doors, key-locked doors, and layered door transitions between levels.These additions enhance the gameplay experience and improve the overall game blueprint.

The nurse's note.

I also created collectible notes placed throughout the map.By picking them up, players can gain a deeper understanding of the game's story and background.

I also created hideable cabinets placed throughout the map, allowing players to enter them to evade pursuing enemies.

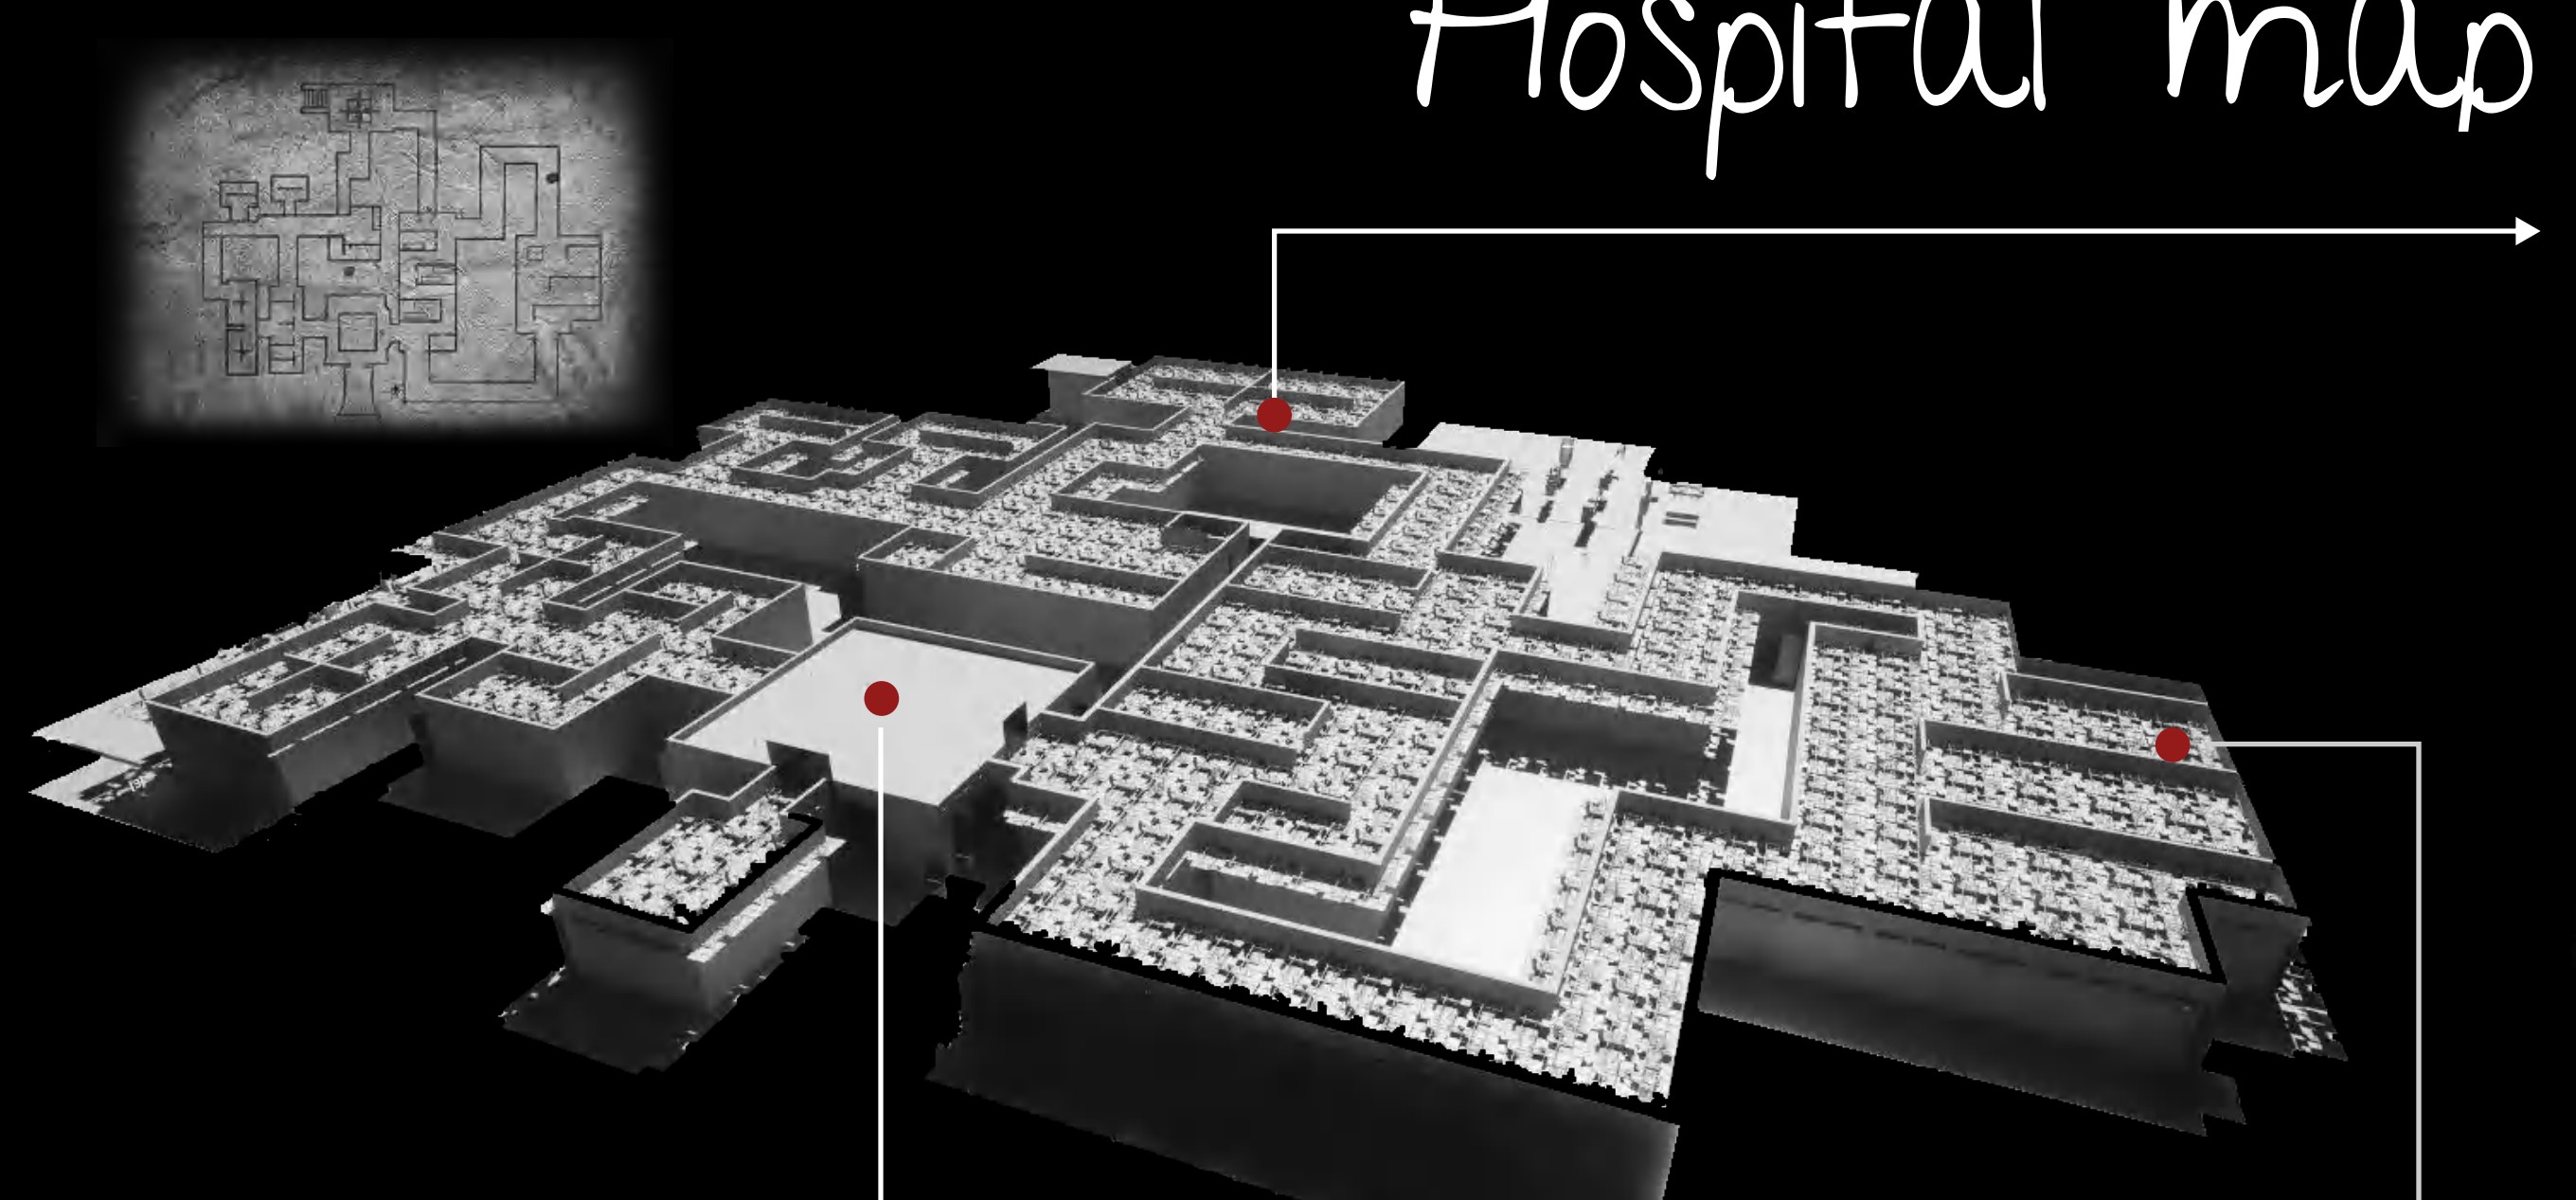
Infected SWAT

Once sent to seal the hospital, they lost their minds after exposure to the drug.Now they patrol by instinct, carrying out forgotten orders.

Deranged doctor

Leader of the Echosine project, driven mad by his pursuit of perfection.
He still "treats" corpses in the dark, believing he's saving lives.

Hospital map



Office Area

Hospital

My Map 1 is set inside a hospital, where the protagonist enters the abandoned building to investigate.
I first built the scene framework and basic object layout during the white-box phase, then proceeded with scene and asset replacement to refine the environment.
I also designed the level map and created several interactive blueprints, such as a flashlight system, to enhance gameplay and immersion.
Finally, I added a PostProcessVolume with a black-and-white filter to strengthen the horror atmosphere.

Lobby

Storage Room

Basement map

Basement

My Map 2 is set in an underground basement, resembling a ritual sacrifice site filled with blood and violence.
I first built the scene framework and basic object layout during the white-box phase, then proceeded with scene and asset replacement to complete the environment.
I also designed the level map and created several interactive blueprints, including a chase AI system.
The AI can patrol, search for the player, chase, and attack, greatly enhancing tension and gameplay immersion.
Finally, I added a PostProcessVolume. In terms of level design, I reduced the space in some core areas to create a sense of visual pressure, arranged support pillars to obstruct the player's line of sight, and applied a black-and-white filter to reinforce the dark, horror atmosphere.

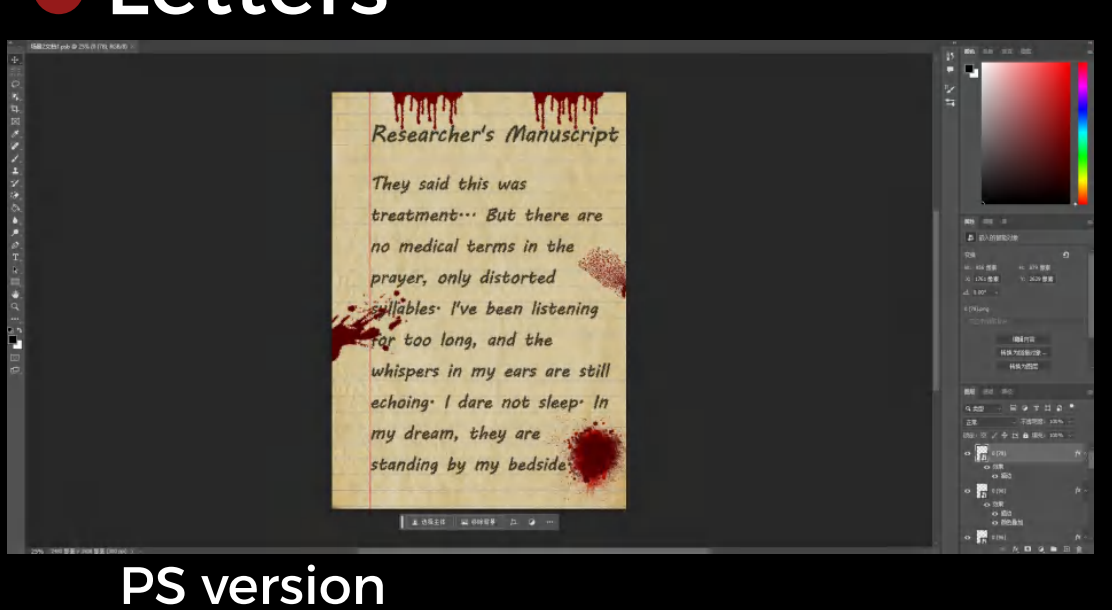
Letters



Researcher's Manuscript

They said this was treatment… But there are no medical terms in the prayer, only distorted syllables. I've been listening for too long, and the whispers in my ears are still echoing. I dare not sleep. In my dream, they are standing by my bedside

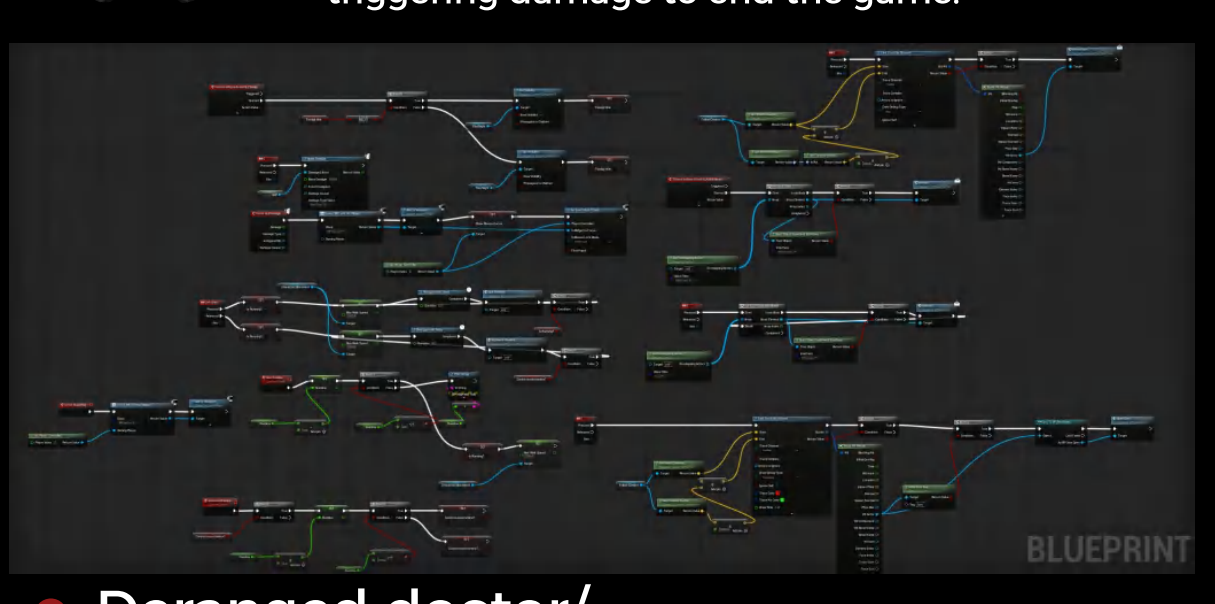
Game Blueprint

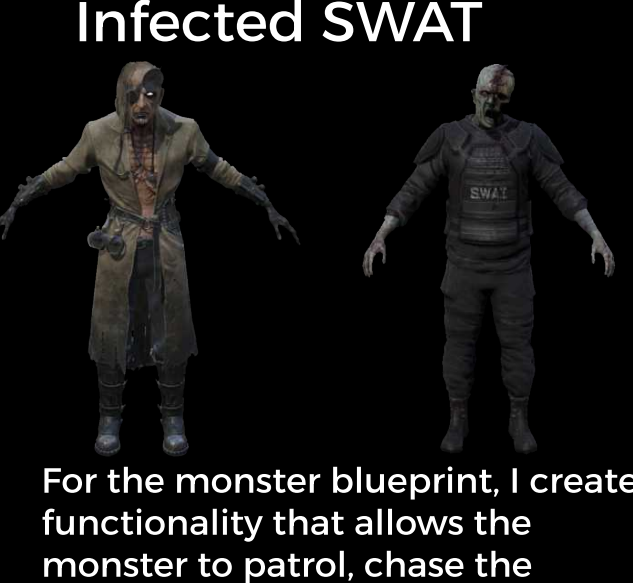
Character Blueprint

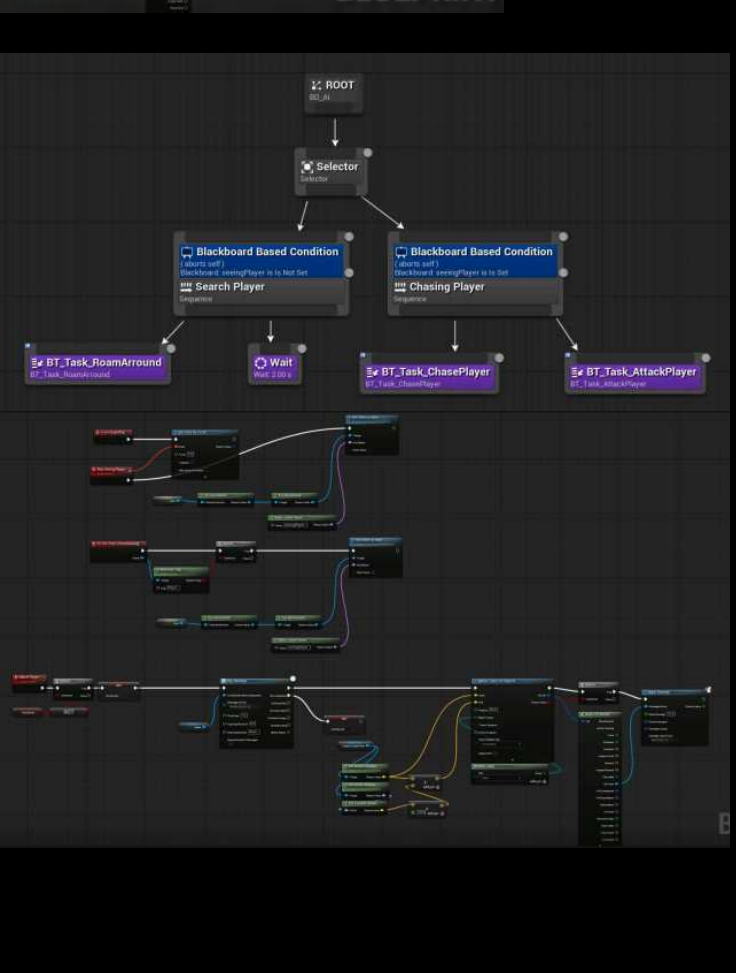
Tom

I followed blueprint tutorial videos on YouTube and created my own game blueprints.
For the character blueprint, I implemented interaction buttons so that objects can be triggered by specific keys, as well as systems for running, an energy bar, flashlight usage, and triggering damage to end the game.



Deranged doctor/ Infected SWAT





For the monster blueprint, I created functionality that allows the monster to patrol, chase the protagonist, and capture the player to inflict damage, enhancing the game's horror mechanics and tension.

Item Blueprint

Portal

For the scene interactive object blueprints, I created systems for portals to the next level, key and regular door interactions, note pickups, hiding in cabinets, and victory UI triggers, enhancing player interaction and gameplay immersion.
