The Steamforge

In an age shrouded by steel and coal smoke, where the sky is veiled in black steam and the earth echoes with thunderous roars, mere giants a workshop that never ceases — known to all as the Steamforge.This is no ordinary factory, but a colossal mechanical foundry forged from countless gears, pipes, and power furnaces.Legend speaks of a great clockwork heart at its core, a mechanism that never halts, driving the forge's endless production.Here, machines are no longer mere tools — they are granted a rhythm like a soul, rising to safeguard humanity.

Inspiration

1. The First version

References :

2. The refined prototype and body

References :

First Core Body

After a series of designs, I completed the prototype of the first version. This is a core block, which is convenient for cabling various body parts.

3. The final versions

Final Core Body

However, the previous blue base could not be well compatible with all the components, and a final body that could be compatible with all the components was made.

Final Render :

Quad Mechanist

Spider Patroller

Crawler Guardian

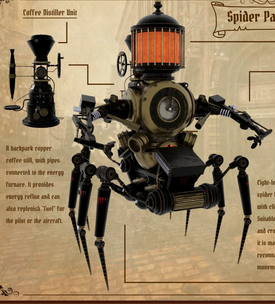

Hover Scout

On this page, I present the creative inspiration behind the project. The initial idea came from combining an octopus with a coffee machine, and my first concept was to design an "octopus coffee machine master." As the work progressed, I became increasingly influenced by steampunk aesthetics and the post-apocalyptic style of Fallout 4, which led me to explore new directions and references. Ultimately, I decided to merge these elements, iterating on the design to create the mechanical body. Later, I incorporated additional references for weapons and equipment to enrich the verse, expanding the concept into a modular, steampunk-inspired mech series. This process culminated in the design and production of the complete set of works presented here.

Spider Patroller

Coffee Distiller Unit

A backpack copper coffee still, with pipes connected to the energy furnace. It provides energy reflux and can also replenish 'fuel' for the pilot or the aircraft.

Hydraulic Claw Arm

Heavy mechanical arm, equipped with multi-functional steel claws at the end. Suitable for high-intensity transportation and close combat attacks.

Power Furnace

The transparent furnace body is the core of the combustion energy inside. It can provide additional energy, enabling the machine to operate for a longer time and have stronger explosive power.

Spider Legs

Eight-legged hydraulic spider legs, flexible joints, with climbing claws. Suitable for climbing walls and crossing rough terrain, it is mainly used for reconnaissance or rapid maneuvers.

Quad Mechanist

Smoke Exhaust Tower

Tall steam exhaust pipes with gear guards. Connect the excess steam into a jet boost to enhance maneuverability in a short period of time.

Flexible Coil Arm

The serpentine robotic arm features a multi-section flexible structure. Flexible operation, capable of completing delicate tasks in confined Spaces.

Gentleman Top Hat

An elegant steampunk top hat. Equipped with advanced optical lenses to enhance long-range reconnaissance capabilities.

Quad Stabilizer

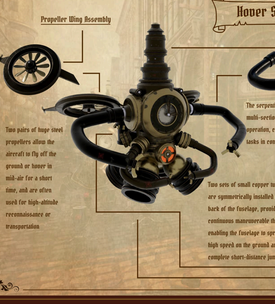

Four thick hydraulic props, each equipped with a stabilizer. It offers excellent stability and is suitable for fixed operations, such as factory matchkeeping or heavy machine platforms.

Hover Scout

Propeller Wing Assembly

Two pairs of huge steel propellers allow the aircraft to fly off the ground or hover in mid-air for a short time, and are often used for high-altitude reconnaissance or transportation

Flexible Coil Arm

The serpentine robotic arm features a multi-section flexible structure. Flexible operation, capable of completing delicate tasks in confined Spaces.

Steam Hat

High-top cylindrical cap design, with a copper exhaust valve on the cap body. It is equipped with a small built-in steam injector to release high-pressure steam to intimidate the enemy.

Twin Turbine Unit

Two sets of small copper turbines are symmetrically installed on the back of the fuselage, providing continuous maneuverable thrust, enabling the fuselage to operate at high speed on the ground and even complete short-distance jumps.

A pair of magnetic levitators, with blue arc light emitted from the bottom. It can hover for a short time and is suitable for rapid maneuvering and crossing obstacles.

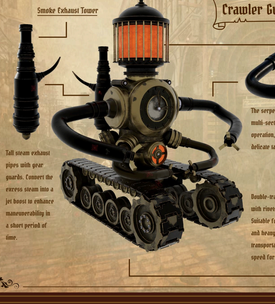

Hover Coil

Crawler Guardian

Smoke Exhaust Tower

Tall steam exhaust pipes with gear guards. Connect the excess steam into a jet boost to enhance maneuverability in a short period of time.

Flexible Coil Arm

The serpentine robotic arm features a multi-section flexible structure. Flexible operation, capable of completing delicate tasks in confined Spaces.

Power Furnace

The transparent furnace body is the core of the combustion energy inside. It can provide additional energy, enabling the machine to operate for a longer time and have stronger explosive power.

Track Crawler

Double-track rail system with rivets for fixation. Suitable for long marches and heavy-load transportation, sacrificing speed for endurance.

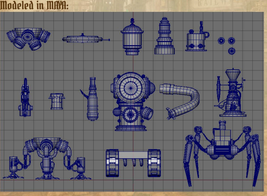

Model matching

Process

This page presents the complete production workflow of the model. Beginning with the modeling stage in Maya, it first shows a comparison between the un-smoothed (pre-supporting edge) version and the refined version with supporting edges. Following this, the UV unwrapping, which I completed independently in Maya, is displayed. Based on this foundation, the model was then imported into Substance Painter for texturing and painting, giving it the detailed look and steampunk-inspired materials. Finally, the fully assembled modular mech was brought into Unreal Engine for real-time rendering and presentation. This workflow demonstrates the entire pipeline from modeling and UVs to texturing and engine implementation.

Modeled in MAYA:
